Mismatch Analysis

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
BSMA0055	0 = Exclude	1 = Include	NA	The study collects quantitative survey data from individual organizational employees (frontline service employees) and reports statistical effect sizes (correlations) for individual employee boundary-spanning behaviors (external representation, internal influence) and their antecedents.. Verbatim Evidence: "[Abstract] "Using a sample of 281 frontline service employees of a national retail bank, we test a social exchange model of antecedents of three dimensions of customer-oriented boundary-spanning behaviors suggested by prior boundary-spanning and services marketing/management literatures: external representation, internal influence, and service delivery." [Sample and procedure] "A sample of FSEs of a major, multi-state retail bank was used to test the hypotheses." [Assessment of construct reliability and validity] "Table 2 reports

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
				Cronbach alpha internal consistency reliabilities, average shared variance estimates, and latent construct intercorrelations.""
BSMA0095	0 = Exclude	1 = Include	NA	The study provides quantitative survey data from 73 individual project leaders and reports an effect size of interest (Pearson correlations) between the leader's ambassadorial boundary spanning behavior (measured via Ancona & Caldwell's items) and other variables.. Verbatim Evidence: "[Abstract] "A PLS analysis of a sample of 73 French project leaders involved in NPD projects provided support for our hypotheses." [Sample and data collection] "As 10 of these questionnaires were incomplete, our final sample consisted of 73 valid questionnaires completed by NPD project leaders." [Measures] "we wanted to capture TMS as the outcome of intentional actions, rather than as a variable that is exogenous to the team leader.""
BSMA0126	0 = Exclude	1 = Include	N/A	The study is a primary empirical paper that collected quantitative survey data from individual business-to-business salespeople and reports statistical effect sizes (correlations) for boundary spanning behaviors (adaptive selling) and performance.. Verbatim Evidence: "[Sample] "The sample frame, therefore, was restricted to business-to-business field salespeople employed by manufacturing firms." [Sample] "Responses were received from 155 salespeople and their respective managers." [Measures] "The salesperson responded to sixteen items assessing the degree to which they engage in adaptive selling behaviors (Spiro and Weitz 1990)." [Results] "The internal reliability of the measures was assessed using the average pairwise correlation. See Table 4: Correlations and Coefficient Alphas.""
BSMA0127	0 = Exclude	1 = Include	None	The study provides a correlation matrix with effect sizes for boundary spanning measured at the individual employee level.. Verbatim Evidence: "[Abstract] "we perform social network analysis and linear mixed effects modeling to analyze archival data comprising 36 IS workers and 23,450 support requests made by 4568 end-users" [Measures] "We use Shannon's [50] entropy measure to calculate the diversity of users who are from different business units in the organization and are supported by IS worker i. This measure is used to capture the extent of varied experience through business boundary spanning.""
BSMA0194	0 = Exclude	1 = Include	N/A	The study collected quantitative survey data from individual boundary spanning employees (LSP representatives on-site at customer facilities) and reports an individual-level correlation matrix (Table 5) that includes boundary spanning knowledge exchange behavior.. Verbatim Evidence: "[Data collection] "The single contact then distributed the letter to boundary spanners working at customer facilities. This process resulted in the dissemination of 750 surveys." [Measurement development] "Knowledge exchange and innovation performance were assessed with measurement items from the perspectives of both the LSP representative

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
				and the customer representative." [Table 2] "I move projects forward by exchanging ideas with members of my host firm"
BSMA0211	0 = Exclude	1 = Include	N/A	The study collects quantitative survey data from individual organizational employees (purchasing managers) to measure their boundary spanning roles and reports statistical effect sizes (correlations) between specific roles and social benefits, meeting all inclusion criteria.. Verbatim Evidence: "[SUMMARY] "This study explored the relationship between purchasing managers' involvement in multiple boundary spanning roles and their perceptions of positive social outcomes related to work." [Sample Characteristics] "A total of 134 completed questionnaires were returned for a response rate of 25.3 percent. Job title classifications were adapted from a previous study (Carter and Narasimhan 1994). The majority of respondents indicated that they were purchasing managers or senior purchasing officers." [Measures] "Boundary spanning roles. A 23-item scale describing the activities associated with each boundary spanning role was developed."
BSMA0251	0 = Exclude	1 = Include	N/A	Meets inclusion criteria: primary empirical study measuring individual-level network citizenship behavior (boundary spanning) and individual innovative behavior, with calculable effect sizes derived from simple regression R-squared values.. Verbatim Evidence: "[Abstract] "To bridge these gaps, the new concept of network citizenship behavior (NCB) was examined. NCB describes individual extra-role behavior exhibited by those who work in organizations that are part of a goal-directed multi-organizational network that supports the social and psychological environment in which the achievement of network-focused goals takes place." [Population and Sampling] "The population of this study consists of employees who work for the local government jurisdictions in this network. It included employees who communicate with people from other jurisdictions or attend interjurisdictional committees, projects, legislative meetings, and other functions at MWCOG." [Chapter 4: Data Analysis] "First, a simple regression model was conducted to test if NCB significantly predicted IIB. The results of the regression indicated that NCB explained 17.8% of the variance in IIB ($R^2 = 17.8$, $F(1, 85) = 18.436$, $p < .05$)."
BSMA0260	0 = Exclude	1 = Include	N/A	N/A. Verbatim Evidence: "N/A"
BSMA0303	0 = Exclude	1 = Include	N/A	The study collected quantitative survey data from employees and leaders in organizations, measuring boundary spanning behavior at the individual leader level, and reported statistical effect sizes (correlations) in Table 1.. Verbatim Evidence: "[Abstract] "A sample of 170 employees and 93 leaders were collected from South Korean organizations. Data were analyzed using path analysis." [Measures] "Leader boundary spanning behavior (BSB). Leader BSB rated by his or her immediate

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
				subordinate was measured by using the 24-item scale developed by Ancona and Caldwell (1992)." [Results] "The means, standard deviations, reliability estimates, and inter-correlations of the study variables are shown in Table 1.""
BSMA0304	1 = Include	0 = Exclude	1 = No effect size of interest	The study examines leader boundary-spanning behavior as the independent variable and subordinate creative behavior as the dependent variable. Since the leader is the focal boundary spanner, but all dependent and moderating variables (as well as demographics) in the correlation matrix belong to the subordinate, this constitutes a cross-entity violation. As there are no variables describing the focal leader beyond their boundary-spanning behavior, there are no effect sizes of interest.. Verbatim Evidence: "[Abstract] "The authors conducted a cross-sectional survey involving 260 supervisor-subordinate dyads from various companies in South Korea." [Sample and procedure] "We initially had distributed questionnaires to 339 independent dyads and collected 267 dyads, giving a response rate of 79%." [Measures] "In order to minimize potential common method bias effect (Podsakoff et al., 2003), employee creative behavior was rated by the employees' direct supervisor while other variables (i.e. leader's boundary-spanning behavior, need for status, creative self-efficacy and control variables) were rated by the employees.""
BSMA0338	0 = Exclude	1 = Include	N/A	The study examines individual-level boundary-spanning behaviors among 521 full-time project team members.. Verbatim Evidence: "[Abstract] "Data from 521 project-team members in construction and engineering industries revealed that the more individuals worry about their project team's acceptance (group attachment anxiety), the more likely they are to perceive intergroup competition, and thus put more efforts into operating external linkages and resources to help their own teams outperform competitors." [Sample] "Of the 521 total respondents, 255 were female (48.9%) and 266 were male (51.1%)." [Measures] "We adapted nine items to measure boundary-related activities (Ancona and Caldwell, 1992). Respondents were asked to indicate the extent to which they felt several listed behaviors were part of their responsibility in dealing with non-team members.""
BSMA0339	0 = Exclude	1 = Include	N/A	The study collected quantitative data from 72 individual full-time healthcare employees, measuring their individual boundary spanning behavior via sociometric sensors and reporting statistical effect sizes (correlations) between boundary spanning and other individual-level variables like job dissatisfaction and role centrality.. Verbatim Evidence: "[Abstract] "The authors find supporting evidence in data on ideas generated over 18 months by health professionals in 12 clinics." [Staff work experience surveys] "At the start of the 18-month study period, we administered the survey via e-mail or paper to all 72 team members in the 12 centers, with 100% participation. Participants were full-time

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
				employees." [Boundary spanning] "Boundary spanning of each individual was measured using the external to internal index (E-I Index), an established social network measure (Krackhardt & Stern, 1988), which was calculated using data from the sociometric sensors.""
BSMA0356	0 = Exclude	1 = Include	NA	This study is a quantitative empirical study at the individual level. It collected survey data from 438 boundary spanning employees (from logistics service providers and customers) and reports Pearson correlations for constructs including inter-organisational team identification and team communication.. Verbatim Evidence: "[Abstract] "Focusing on this research gap, the present study extends LORM research into inter-organisational team identification (IOTI) research by investigating the perspectives of boundary-spanning employees (BSEs) from logistics service providers (LSPs) and their customers (Logistics service customers, LSCs)." [4.4 Level of analysis] "To avoid 'aggregation biases and drawing inappropriate conclusions from confusion over levels of analysis" (Tesluk & Mathieu, 1999, p. 206), those constructs were measured as individual-level variables at either IOT or organisational level (i.e., the level of analysis is individual)." [5.3.3 Demographics Analysis] "Of the 438 responses included for analysis, 38.8% identified as female, 58.2% identified as male... 324 (74%) were from the LSP side, while 114 (26%) were from the LSC side." [5.3.4 Descriptive Statistics and correlations of model variables] "Table 5.9 shows the correlations between the study variables.""
BSMA0383	0 = Exclude	1 = Include	NA	Study meets all criteria for inclusion: it is a primary empirical study measuring individual-level boundary spanning behavior among product managers and reports bivariate correlations.. Verbatim Evidence: "[Abstract] "Boundary spanning theory and role theory are used to examine the product manager's role in consumer industries. A research model depicting associations between environmental uncertainty, boundary spanning, role conflict and ambiguity, job satisfaction, tension and performance, and moderating variables is developed and tested with bivariate correlations, path analysis, and ANOVA." [The Sample] "The hypotheses were tested with data obtained from questionnaires mailed to 449 product managers in consumer package goods industries, as 85% of them have product managers. The final sample for analysis totalled 170." [Boundary Spanning] "Boundary spanning, defined as communication beyond a product manager's department, was measured by refining an instrument developed by Aiken and Hage (1972) and used by Leifer (1975).""
BSMA0411	0 = Exclude	1 = Include	N/A	The paper meets all inclusion criteria. It is a primary empirical study conducted at the individual level using a sample of organizational employees, and it provides a correlation matrix including boundary spanning positions.. Verbatim Evidence: "[Abstract] "Data collected from a 116-member high-tech firm showed support for this mediation

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
				hypothesis: relative to low self-monitors, high self-monitors tended to experience greater role conflict in work organizations because high self-monitors were more likely to occupy boundary spanning positions." [Sample] "This research was part of a larger study conducted at a high-tech firm located in the northeastern USA." [Measures] "Of the 116 positions in the firm, 28 boundary spanning positions were identified by the human resources director.""
BSMA0441	0 = Exclude	1 = Include		Individual-level empirical study of role stress among boundary-spanning retail managers in a horizontal alliance. N=218 managers of dual-branded retail oil outlets in Norway. Reports bivariate correlations (Table 3) between role ambiguity, role conflict, and multiple effectiveness outcomes (competence, customer satisfaction, contributions to sales, bargaining efforts). Quantitative survey data with structural equation modeling provides usable effect sizes.. Verbatim Evidence: "[Abstract] "The coalition of disparate corporate cultures yields appreciable levels of role stress for people in boundary-spanning positions." [Abstract] "Data gathered with 218 managers of dual-branded retail oil outlets indicate that the relevance of these alternative perspectives is mitigated by the form of effectiveness pursued by the organization." [Sampling Procedure] "The data were collected through surveys sent to each retail manager in the network... The response rate was 55.9% (218 of 390 responses)." [Measures] "The role stress scales were based on the seven-point measures developed by Rizzo, House, and Lirtzmann (1970). The conflict and ambiguity measures consisted of six and seven items, respectively.""
BSMA0443	0 = Exclude	1 = Include		Quantitative primary study surveying 264 individual B2B service-sector executives (employees) on Capacity for Social Exchange, Knowledge Sharing, Knowledge Channels (boundary-spanning strategies across supply chain partners), and Innovation Speed. Reports bivariate correlations and SEM path coefficients at the individual level of analysis. Knowledge Channels are explicitly defined as boundary-spanning strategies and measured at the individual respondent level.. Verbatim Evidence: "[Abstract] "This study aims to introduce the concept of capacity for social exchange (CSE) in buyer-supplier relationships, which reflects the degree to which individuals possess competencies that enable the exchange of information, and this study also explores how CSE affects knowledge sharing and innovation speed within a supply chain organization." [Methodology] "The data was collected from 264 B2B service sector executives." [Methodology] "The respondents were screened to ensure a sampling of only full-time and mid-to-high-level managers and executives in the service industry." [Measures] "KC refer to the boundary-spanning strategies used by organizations that permit the transfer, recombination and/or creation of knowledge among supply chain partners (Rosenzweig and Roth, 2007)." [Results] "The first-order correlation between CSE and innovation speed was highly significant ($r = 0.407$, $p < 0.001$).""

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
BSMA0449	0 = Exclude	1 = Include		Primary empirical study of individual-level boundary-spanning salespeople (N=157 dyads) in healthcare organizations. Reports bivariate correlations (Table 1) between trust, communication, strategic activities, and sales performance. Individual employee sample with extractable effect sizes.. Verbatim Evidence: "[Abstract] "Exploring dyadic relationships we found that the extent to which contact personnel trust their supervisors positively influence their willingness to participate in strategic activities." [Introduction] "As boundary spanners, customer contact personnel provide an important link between the organization and its customers and provide a potentially valuable source of strategic information to managers." [Sample] "Of 450 firms initially expressing interest and pre-qualifying for participation via phone calls, 132 dyads were received from the first wave of data collection and 25 were received from the second wave resulting in a total of 157 matched dyads representing 67 distinct firms (or managers)." [Measures] "Trust was measured using Doney and Cannon's (1997) eight-item measure of trust ($\alpha=0.87$, average variance extracted=0.69)." [Measures] "Supervisors also reported on salesperson performance using the Sujan et al. (1994) six-item measure and salesperson participation in strategic activities using the Floyd and Wooldridge (1992) twenty-item measure.""
BSMA0450	0 = Exclude	1 = Include		Individual-level empirical study of 89 mid-level managers in a US hospital. Measures boundary-spanning responsibilities and divergent strategic activity with bivariate correlations and regression results reported.. Verbatim Evidence: "[Abstract] "Using a sample of 89 mid-level managers in a US based urban hospital, this study investigates relationships among three measures of network centrality and managers' divergent strategic activity." [Abstract] "Consistent with existing research, the findings also show boundary-spanning managers to be more strategically active than their non-boundary-spanning counterparts." [Sample] "In the end, all but one potential participant completed the quantitative survey giving us a final sample of 89 mid-level professionals." [Measures] "To measure divergent strategic activity we asked each respondent to rate two or three of their peers on 20 Likert-type items developed by Floyd and Wooldridge (1992, 1996, 1997) to assess how frequently middle managers perform various strategic activities (1 = never, 5 = frequently)." [Results Table 1] "Boundary-spanning mean = 0.38, Champion mean = 17.33, Facilitate mean = 16.40; correlations between boundary-spanning and Champion $r = 0.435$, boundary-spanning and Facilitate $r = 0.324$.""
BSMA0456	0 = Exclude	1 = Include		Individual-level empirical study of boundary spanners (purchasing managers and supplier representatives) in buyer-supplier dyads (N=119 dyads, 238 respondents). Reports zero-order correlations (Table 2) and hierarchical regression coefficients (Table 3) for trust in boundary spanners predicted by role autonomy components (functional influence, tenure, clan culture). Quantitative survey design with extractable effect

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
				sizes.. Verbatim Evidence: "[Abstract] "We test hypotheses linking the components of role autonomy to trust on a sample of 119 buyer-supplier relationships. We use a dyadic research design that combines data from purchasing managers and supplier representatives." [Methods - Data Collection] "After eliminating questionnaires with missing values, there were 119 complete dyads (238 usable responses) available." [Methods - Measures] "We developed a measure of the supplier representative's trust in the purchasing manager based on a measurement instrument of trust in close, interpersonal relations, created and validated by Rempel et al. (1985)." [Results] "We find evidence in support of the first hypothesis, that functional influence is negatively related to trust in the purchasing manager. The coefficient is negative and statistically significant ($\beta = -0.028$, Std. Error = 0.014; $p < 0.05$)."
BSMA0460	0 = Exclude	1 = Include		Individual-level survey of 107 non-supervisory employees in two organizations (military supply department and financial corporation). The study examines boundary spanning activity as a moderator of work setting → behavior relationships and reports bivariate correlations (e.g., $r = .392, .245, .188$) between work setting characteristics and on-the-job behaviors, as well as correlations comparing boundary spanners vs. non-spanners. Boundary spanning is measured at the individual employee level via self-report of job-related interaction with organizational outsiders.. Verbatim Evidence: "[Abstract] "A survey of 107 non-supervisory employees in two organizations provided the data for the study." [Abstract] "Furthermore, the moderating effects of involvement in boundary spanning activity on the above relationships were also explored. It was hypothesized that involvement in boundary activity weakens the relationships between the work setting characteristics and behavior." [Methods - Research Sites] "Respondents in both organizations were all non-supervisory, full-time, paid employees." [Methods - Boundary Spanning Activity] "Boundary spanning activity is defined as any job activity which includes interaction by the organizational member with individuals who are not members of the organization."
BSMA0486	0 = Exclude	1 = Include	NA	The study is a primary empirical quantitative survey that collected data from individual employees (N=420) and reports statistical effect sizes (Pearson correlations) between boundary-spanning leadership dimensions and employee performance outcomes.. Verbatim Evidence: "[Abstract] "The research involved 420 employees from companies in the finance, trade, services, and investment industry sectors in Indonesia." [Instrument] "For BSL, indicators were collaboration across functions (CAF), empowering employees at all levels (EEAL), and developing cross-organizational learning capabilities (DCLC) (Yip et al., 2016)." [Result] "As shown in Table 2, The descriptive analysis result indicates the mean value indicators of BSL... overall, the correlation between indicators is significant at $p < 0.01$."

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
BSMA0509	0 = Exclude	1 = Include	NA	The paper is a primary empirical study providing individual-level correlations for boundary-spanning leadership among an employee sample (humanitarian aid workers).. Verbatim Evidence: "[Sample] "Our sample consisted of 137 humanitarian aid workers who voluntarily participated in an anonymous online survey." [Measures] "We measured boundary-spanning leadership using a three-item scale adopted from the Intergroup Rhetoric Scale by Rast (2013)." [RESULTS] "The independent variable boundary-spanning leadership showed a statistically significant and positive correlation with the mediator collaboration ($r = .67, p < .001$)."
BSMA0512	0 = Exclude	1 = Include	None	Study meets inclusion criteria by reporting quantitative data on individual-level boundary spanning behavior of public managers (N=158) and providing statistical effect sizes (correlations).. Verbatim Evidence: "[Abstract] "The data for this study are composed of 158 survey responses from lead public managers involved in Dutch national public infrastructure projects." [3.1. Sampling and data collection] "This brings the number of observations in the dataset to a total of 158 (from 58 projects)." [3.4.1. Boundary spanning] "A new scale was developed to measure the construct of boundary spanning, based on the four types of boundary-spanning activities discussed in Section 2."
BSMA0591	1 = Include	0 = Exclude	1 = No effect size of interest	The study focuses on work-life boundary management preferences (integration vs. segmentation) and work communication on social media. Due to construct homonymy, 'boundary preference' here refers to personal/professional work-life boundaries rather than organizational boundary spanning behavior.. Verbatim Evidence: "[Abstract] "This study examines how employees' boundary management preferences influence their work communication on social media, and how these factors impact their engagement." [Measures] "First we measured boundary preferences along a continuum based on existing measures by Kreiner, Hollensbe, and Sheep (2006) and Ilies, Wilson, and Wagner (2009). Participants rated 초 rated their agreement with six statements relating to integration and segmentation preferences on a 5-point scale ranging from: 1 = not at all to 5 = very much."
BSMA0604	0 = Exclude	1 = Include	NA	Study is a primary empirical paper examining individual frontline employees' boundary-spanning behaviors and reports correlations.. Verbatim Evidence: "[Abstract] "Data were gathered from 651 full-time hospitality employees across 12 hotels in China." [Measures] "For measuring the three dimensions of BSBs, Bettencourt and Brown (2003) developed a nine-item scale and Bettencourt et al. (2005) extended it into a 13-item scale, including ER (four items), II (four items) and SD (five items)" [Results] "Table 3 shows that the AVE scores, positioned on the diagonal of the matrix, surpassed the squares of the off-diagonal, paired correlation coefficients, thus confirming discriminant validity."

Article ID	Human Status	AI Status	AI Reason Code	AI Notes (Verbatim Evidence)
BSMA0606	0 = Exclude	1 = Include	N/A	The study empirically examines individual frontline hospitality employees' boundary-spanning behaviors and provides quantitative effect sizes, meeting all inclusion criteria.. Verbatim Evidence: "[Abstract] "Based on the analysis of 597 hospitality frontline employees in the United States, which were recruited through Amazon Mechanical Turk, this study shows the differential impacts of organizational support types on driving boundary spanning staff to effectively operate on the boundary." [Methodology] "Two screening questions were implemented at the beginning of the questionnaire, \"Do you work in the hospitality industry (e.g., hotels, restaurants, resorts) in the United States?\" and \"At work, do you directly interact with guests daily?\" to recruit frontline employees in the hospitality industry only." [Findings] "The sample contains 325 males and 270 females.""
