

Meta-Analysis of Boundary Spanning (BSMA)

Phase 1 Screening Step Results & Efficiency Report

Date: July 3, 2026	Author: Antigravity (AI Orchestrator)
Target File: BSMA_Master_Coding_Sheet.xlsx	Total Universe: 701 Candidate Articles

1. Executive Summary

Before initiating intensive full-text coding—such as harvesting sample demographics, measure descriptors, reliability alphas, and bivariate correlation matrices—the research team instituted a strategic **1st Screening Step** across the entire universe of 701 candidate articles (*BSMA0001* through *BSMA0701*).

The primary objective of this screening phase was to systematically evaluate each article against the core meta-analytic inclusion criteria and filter out ineligible studies early. This architectural decision yielded immense operational and methodological benefits:

KEY STRATEGIC OUTCOME:
*Out of 701 initial candidate articles, exactly **388 papers (55.3%)** were confirmed as eligible for full-text coding (**1 = Include**), while **313 papers (44.7%)** were identified and excluded (**0 = Exclude**). Eliminating nearly 45% of the initial pool prior to full-text data extraction prevents substantial wasted time, computational overhead, and potential data extraction errors.*

2. Overall Screening Classification Table

All 701 articles were analyzed using their full bibliometric descriptors (Title, Abstract, Publication Name) and full-text keyword scanning via PyMuPDF. Every judgment was recorded directly into Column E (*Inclusion-Exclusion Judgment*) of the Master Coding Sheet without altering any subsequent coding fields.

Classification Status (Col E / Col 5)	Count	% of Pool	Description & Eligibility Status
1 = Include (Eligible)	388	55.3%	Empirical quantitative studies measuring boundary spanning behavior at the individual employee/leader level and reporting statistical effect sizes.
0 = Exclude (Ineligible)	313	44.7%	Studies excluded based on standardized exclusion criteria (macro level, lack of effect sizes, non-employee samples, or non-primary data).
Total Analyzed	701	100.0%	Represents 100% bijection with Final list(BSMA).xlsx (Rows 4 to 704 in Master Coding Sheet).

3. Detailed Breakdown of Exclusion Reasons (313 Papers)

When excluding a paper, standardized exclusion codes were recorded in Column F (*Reason for Exclusion*), and specific methodological justifications were documented in Column P (*Notes*). Every single excluded paper mapped cleanly to one of four primary categories:

Reason Code (Col F)	Count	% Excl.	% Total	Detailed Rationale & Typical Examples
3 = non-individual level	133	42.5%	19.0%	Macro or Group Level Analysis: Examines boundary spanning at the team, business unit, firm, board of directors, supply chain, multiteam system (MTS), or inter-organizational alliance level rather than individual employee behavior. (<i>e.g., NPD team intelligence, firm technological alliances, bank branch autonomy</i>).
1 = No effect size of interest	109	34.8%	15.5%	Missing Statistical Effect Sizes: Empirical studies investigating individual organizational members, but failing to report quantitative bivariate correlation (<i>r</i>) or regression matrices linking boundary spanning behavior to outcome variables.
2 = Non-employee samples	41	13.1%	5.8%	Non-Workplace Populations: Studies sampling non-employee subjects such as general consumers, hospital patients, university students, citizens, municipal governments, prescribing physicians, or adventure tourists.
4 = Non-primary study	30	9.6%	4.3%	Theoretical / Conceptual / Review: Conceptual frameworks, literature reviews, theoretical models, editorials, typologies, or previous meta-analyses lacking an original primary empirical dataset. (<i>e.g., articles published in AMR, IJMR, or conceptual chapters</i>).
5, 6, 7, 99 (Other Codes)	0	0.0%	0.0%	Zero Occurrences: No duplicates (6), non-English publications (7), or unclassifiable edge cases (99) were found during screening.
Total Excluded Pool	313	100.0%	44.7%	All 313 excluded papers strictly assigned and documented.

Report Conclusion — End of Document.
