ABSTRACT

To comprehend the mechanism of decent work's impact on employee boundary-spanning behaviour, this paper constructs a research framework that includes promotion focus and a supportive organizational climate as a mediating factor and moderating variable. A two-stage survey is used to examine these assumptions with data collected from 346 frontline employees. The findings reveal that decent work has a significant positive impact on employee boundary-spanning behaviour and promotion focus has a partial mediating effect on this relationship. A supportive organizational climate plays a positive moderating role in the relationship between decent work and promotion focus.

KEYWORDS

decent work; employee boundary-spanning behavior; promotion focus; supportive organizational climate; moderated mediation model

1. Introduction

Frontline employees are important for ensuring that enterprises deliver value to customers in the service context and are key to promoting the core competitiveness of the organization. Therefore, tourism enterprises not only stipulate stricter requirements for frontline employees' service motivation, performance standards and other in-role behaviors; they also strongly encourage such employees to obtain resources from external sources, collect information and engage in other boundary-spanning behaviors. Such boundary-spanning behavior is thus necessary for ensuring service innovation and obtaining competitive advantages in a fiercely competitive market environment (Ancona & Caldwell, 1992). Employee boundary-spanning behavior can have reciprocal effects on both the individual and the organization. The more employees engage in boundary-spanning behavior, the higher their level of job fulfillment and satisfaction (Lee & Han, 2020; Marrone et al., 2022; Wang, Fu, and Wang, 2021; Wang, Fu, Wang, and Wei, 2021). Mutually beneficial exchange relationships

promote positive connections and feedback between employees and organizations (Grawe et al., 2014; Lumley et al., 2011). Namely, organizational connectivity is related to organizational commitment. Employees' boundary-spanning behavior establishes stable exchange relationships through trusting cooperation with both internal and external parties, which in turn enhances employees' organizational commitment (Helfers et al., 2019; Wang, Fu, & Wang, 2021; Wang, Fu, Wang, & Wei, 2021). When employee boundary-spanning behavior is recognized and respected by the organization, employees' sense of responsibility to the organization increases, and more work resources are provided by their superiors (Dulebohn et al., 2012; Jiang et al., 2014). From the perspective of social exchange relationships, employees tend to increase the time and energy they invest into their work to reward the organization (Liu et al., 2013). Due to this virtuous circle of organizational relations, the employee's own interests and the competitiveness of the enterprise market can be improved.

At present, due to societal development, the tourism occupation is no longer simply a means for individuals to earn a living (Rasheed et al., 2020). Frontline employees desire social respect and pursue self-worth, while negative social reputations (Lai et al., 2013), professional stereotypes (Mooney, 2016), poor working conditions and other factors related to external pressure that currently affect the tourism industry continue to cause resource depletion and emotional exhaustion (Kang et al., 2012), thus decreasing employees' intentions to engage in boundary-spanning behavior. Moreover, the influence of traditional concepts and the fact that China's tourism industry has not yet developed a service culture similar to that of Western countries leads to frequent vicious incidents, such as customer rudeness, threats or attacks on employees due to unequal interpersonal interactions (Connell, 2013; Gong et al., 2014; Liden et al., 2014). In fact, individuals who continue to suffer from a loss of resources without receiving effective compensation tend to experience burnout, and their positive behavior is inhibited (Kim & Qu, 2019; Wallace & Coughlan, 2023). Therefore, as a result of long-term interactions under conditions featuring unfair, low-quality working conditions and other negative factors, the need to exert constant effort gradually depletes the internal energy of frontline employees, resulting in a decline in their service performance and even causing hidden, retaliatory work withdrawal that leads to high management costs for the organization; these factors represent a "burden" for tourism business operations (Chi et al., 2018; Wang & Wang, 2017). Accordingly, what measures can be taken to help frontline employees in the tourism industry replenish their internal resources and reduce the depletion of resources caused by occupational stress? In what ways can employee boundary-spanning behavior be stimulated? These questions have received a great deal of attention in the context of the human resource management of tourism companies.

Self-determination theory (SDT) emphasizes the mechanism underlying the process by which extrinsic factors are transformed into an individual's internal drive, which in turn motivates his or her behavior. This theory can explain the mechanism underlying the influence of decent work on employee boundary-spanning behavior more effectively (Deci et al., 2001). SDT claims that employees are motivated by situational factors that shape their cognitions and

ultimately influence them to engage in employee boundary-spanning behavior (Deci et al., 2001; Nguyen et al., 2022). Among the many relevant contextual factors, decent work has a nonnegligible influence on the behavioral intentions of frontline employees in the tourism industry (Blustein et al., 2023; Huang & Yuan, 2022; Sheng & Zhou, 2023). This factor can satisfy the deep-seated internal needs of frontline employees for autonomous and competent development as well as enable them to overcome the constraints of traditional values, negative social prestige and professional stereotypes; thus, it has the potential to stimulate their boundary-spanning behavior (Braganza et al., 2021; Maggi & Vroegop, 2023). Therefore, this study uses the SDT paradigm to investigate whether the boundary-spanning behavior of frontline employees in the tourism industry can effectively be promoted when those employees are provided with extrinsic incentives related to decent, productive value-added job opportunities. This question is the first to be answered in this study.

Employee boundary-spanning behavior is the result of the interaction between situational factors and individual traits, which depends on internal psychological perceptions (Akgunduz et al., 2022; Wang et al., 2022). Promotion focus is a motivational state and internal cognition that can be triggered by situational stimuli. Promotion focus has the ability to motivate frontline employees to seek facilitation strategies actively with the aim of achieving their goals at work (Dai et al., 2021). Accordingly, can promotion focus play a mediating role in the relationship between decent work and employee boundary-spanning behavior? This question is the second to be answered in this study.

Social exchange theory (SET) emphasizes the reciprocal exchange that occurs between individuals and organizations, which is key to guiding employee behavior (Akgunduz et al., 2022; Shehawy, 2022). A supportive organizational climate features a focus on employee contributions and a willingness to provide employees with resources and rewards (Deci & Ryan, 2000; Hayat & Afshari, 2021). When employees feel supported by the organization, their internal resources are enhanced, which in turn leads to a strong intrinsic motivation to characterize desired goal states in terms of ambitions and achievements (Alfes et al., 2013; Wang et al., 2014). This situation may motivate employees to engage in boundary-spanning behavior to give back to the organization.

Therefore, can a supportive organizational climate play a moderating role in the relationship between decent work and promotion focus? This question is the third to be answered in this study.

Previous research on employee boundary-spanning behavior has focused on exploring its various impacts, such as its positive effects on employees' task performance and team innovation performance (Yayavaram & Chen, 2015; Zhang & Li, 2021). While empirical studies on the antecedents of employee boundary-spanning behavior have been relatively scarce, sporadic studies have addressed relevant situational factors, such as leadership behavior patterns and organizational structures (Leifer & Huber, 1977; Marrone et al., 2022). Although these studies have highlighted the role of situational factors in employee boundary-spanning behavior, they have failed to analyze the response process underlying employee boundary-spanning behavior from the perspective of intrinsic needs (Blustein et al., 2023; Wang, Fu, & Wang, 2021; Wang, Fu, Wang, & Wei, 2021). In addition, previous studies on the mechanism underlying employee boundary-spanning behavior have taken ordinary corporations as the object of study and have failed to focus on frontline employees in tourism enterprises (Onyemah et al., 2010; Yoo et al., 2014). Moreover, such studies have ignored decent work, a situational factor that is a common concern for frontline tourism employees (Blustein et al., 2023; Sheng & Zhou, 2023). Generally, theoretical and practical analysis of the situational factors affecting employee boundary-spanning behavior remains lacking in the context of tourism enterprises.

Accordingly, this paper explores the mechanism underlying the effect of decent work on the boundary-spanning behavior of frontline employees. The important differences between this study and previous studies are as follows: (1) In this study, we selected only frontline employees in the tourism industry as study subjects (rather than all corporate employees) to ensure the homogeneity of the sample. This approach improved the precision of the study's conclusions. (2) This study introduced the core element of decent work from the perspective of employees' intrinsic need satisfaction and examined its impact on employee boundary-spanning behavior, thus further enriching the research on employee boundary-spanning behavior. (3) This study integrated the SDT and SET perspectives and constructed a moderated mediation model based on the interaction between contextual factors and

individual traits. The mechanisms and boundary conditions underlying the influence of decent work on employee boundary-spanning behavior are systematically examined.

2. Literature review and hypotheses

2.1. Employee boundary-spanning behavior

Employee boundary-spanning behavior refers to the behavior of employees who search for resources and information from the external environment and transfer those resources and information to other (internal) members of the organization with the goals of establishing contact with external stakeholders and achieving work goals (Ancona & Caldwell, 1992; Katz & Tushman, 1983; Marrone et al., 2007). Due to the prevalence of the concept of the "boundaryless organization", tourism companies must cross organizational boundaries frequently to communicate with the external world. In this context, the organization also expects internal staff to devote more energy to external stakeholders to promote improved performance, which is a necessary step in the process by which tourism companies obtain competitive advantages; thus, employee boundary-spanning behavior has also become increasingly important to enterprises (Onyemah et al., 2010; Yoo et al., 2014). In fact, boundary-spanning behavior originates from employees' positive perceptions of job content, the workplace environment and other factors. When employees receive sufficient respect and recognition from the organization and society, they can effectively exhibit the motivation and self-efficacy necessary to engage in boundary-spanning behavior (Chien et al., 2021; Jung & Yoon, 2020; Lin & Li, 2013).

According to SDT, the autonomy and confidence granted to employees by the organization are effective with regard to motivating their autonomous positive behaviors (Deci et al., 2001; Nguyen et al., 2022). Thus, the factors associated with decent work significantly influence employees' boundary-spanning behavior, and this impact is reflected in the following areas. First, decent work emphasizes the basic rights, interests and human dignity of employees, ensuring that employees can experience joy and happiness during the course of work (Amabile & Conti, 1999; Huang et al., 2022). Therefore, when employees have high-level perceptions of decent work within the organization, they exhibit more respect for and recognition of the organization

as well as full self-confidence and an experience of organizational incentives, which subsequently promote their boundary-spanning behavior (Blustein et al., 2023; Nguyen et al., 2022; Wang et al., 2022). Second, decent work inspires perceptions of higher employment quality, trust and coexistence, and it strengthens employees' job autonomy, sense of security and opportunity support (Kozan et al., 2019; Maggi & Vroegop, 2023; Suttawet & Bamber, 2018). Moreover, the inclusion and tolerance entailed by decent work can enable employees to obtain psychological resources and motivate them to dare to engage voluntarily in boundary-spanning behavior (Graça et al., 2021). Finally, at the social level, decent work helps employees perceive the social responsibility or value of their professions. Full respect and positive feedback from the people they serve are external motivators (Harvey et al., 2014; Huang et al., 2021). This analysis shows that decent work satisfies the basic psychological needs of employees, such as work autonomy, competence and confidence. This factor represents a necessary condition for SDT's ability to emphasize employees' behavioral decisions (Deci et al., 2001; Nguyen et al., 2022).

In summary, when frontline employees in the tourism industry experience decent work, they tend to pursue external incentives such as full confidence and social respect, which can be grouped into two categories: autonomy, competence and confidence. These incentives then serve as a "catalyst" for boundary-spanning behavior. Accordingly, this study proposes the following hypothesis:

- H1.** Decent work has a positive impact on employee boundary-spanning behavior.

2.2. Decent work

Decent work is defined as an occupational state in which employees are able to perform their work in a dignified manner based on the satisfaction of their material, cultural and self-development needs (Ahmed, 2003; Di Fabio & Blustein, 2016). Decent work refers to the individual's assessment of positive elements such as their professional reputation and the resources provided based on their inner needs (Blustein et al., 2023; Sheng & Zhou, 2023). Decent work is thus an important extrinsic positive perceived by employees (Amabile & Conti, 1999; Huang et al., 2022).

Decent work has been shown to be a good predictor of employee engagement, organizational

commitment, and creativity tendency (Braganza et al., 2021; García-Rodríguez et al., 2021; Helfers et al., 2019; Wang, Fu, & Wang, 2021; Wang, Fu, Wang, & Wei, 2021; Xu et al., 2022). Namely, the social respect and value-added work opportunities indicated by decent work can be regarded as positive work resources (Blustein et al., 2023; Sheng & Zhou, 2023). Based on such external incentives, employees are eager to work on tasks that are rich, varied and challenging, and they thereby develop positive psychological expectations regarding the results of their work, which in turn lead them to exhibit promotion focus (Jawahar & Liu, 2016; Lanaj et al., 2012).

SDT makes it clear that the influence of external stimuli on employee behavior is not the only effect of direct action (Deci et al., 2001; He et al., 2022). This theory claims that external stimuli are internalized into employees' internal motivation (Deci et al., 2001; Nguyen et al., 2022). Decent work creates an environment that helps frontline employees in the tourism industry meet their development needs and achieve their aspirations. For example, decent work emphasizes the organizational level with regard to the tasks of ensuring human dignity, protecting the basic rights of employees in the workplace, and promoting the recognition of employees' own value (Blustein et al., 2023; Huang & Yuan, 2022). Moreover, supportive situational factors in the workplace and society can cause individuals to feel more competent, thus motivating them to feel happy and immersed in the workplace (Deci et al., 2001). In this process, employees also focus continuously on the organization's performance goals, aligning their mindset and behavior with the organization's expectations through regulation. This alignment satisfies the individual's psychological need for organizational support, autonomous work and competence, as emphasized by SDT (Deci et al., 2001; He et al., 2022). This situation thus generates promotion focus (Luu, 2021; Yadav & Dhar, 2021). Therefore, based on the preceding description, this research proposes the following hypothesis:

- H2.** Decent work has a positive impact on promotion focus.

2.3. Promotion focus

Promotion focus refers to an intrinsic motivation for achievement and a psychological tendency to commit to ideals and goals (Crawford et al., 2010;

Liu et al., 2023). Employees with promotion focus have a strong internal drive for self-development and constantly strive to attain higher performance goals and loftier achievements (Byron et al., 2018; Sacramento et al., 2013). With regard to the efficacy of promotion focus and its underlying logic, this study suggests that promotion focus can play a mediating role in the relationship between decent work and the boundary-spanning behavior of frontline employees in the tourism industry. This pathway takes the following forms. First, as mentioned, promotion focus is an individual trait that is influenced by positive resources such as decent work (Brockner & Higgins, 2001; Luqman et al., 2021). Second, individuals with promotion focus tend to pursue achievements and aspirations, which can be a key element in the task of triggering boundary-spanning behavior among frontline employees in the tourism industry (Lee et al., 2023; Liu et al., 2023). Namely, employees who have promotion focus value their own gains and the achievement of performance goals, and so they connect actively with external sources to obtain resources and information from outside the company (Beldona et al., 2022; Senbeto et al., 2022). In addition, employees who engage in boundary-spanning behavior must take corresponding risks. Unlike defensive focus, promotion focus refers to the trait of actively facing risks and daring to overcome difficulties, which helps employees with such a focus engage in effective boundary-spanning behavior (Byron et al., 2018; Dai et al., 2021; Sacramento et al., 2013). It has been shown that employees with traits related to promotion focus such as proactive personality traits are willing to take risks and challenges and that such employees tend to take the initiative in ways that extend across borders (Henker et al., 2015; Jawahar & Liu, 2016).

In summary, tourism companies that value decent work strongly prioritize the satisfaction of the needs of their employees, such as the needs for social respect, basic rights and values (Blustein et al., 2023; Sheng & Zhou, 2023). In such an organizational context, employees perceive positive resources and thus translate aspirational organizational goals into factors related to promotion focus. Because individuals with promotion focus pursue the goal of achieving and reaching their ideal selves, they are ultimately led to use their skills and abilities to interact with external stakeholders to achieve their goals and increase their effectiveness (Lee et al., 2023; Liu et al., 2023; Senbeto et al., 2022). Thus, such

employees engage in more boundary-spanning behavior. Therefore, based on the preceding description, this research proposes the following hypothesis:

- H3.** Promotion focus has a mediating effect on the relationship between decent work and employee boundary-spanning behavior.

2.4. Supportive organizational climate

A supportive organizational climate refers to employees' overall perceptions of the support and assistance provided to them by the organization, including mutual trust between leaders and subordinates, the resources required for work provided by the organization, and cooperation among teams (Kim et al., 2021; Wang et al., 2017). In fact, the messages that individuals perceive in the organizational climate serve as a starting point for their own motivation and psychological responses, thus transforming external situational factors into internal drivers (Caya & Mosconi, 2023; Schneider & Reichers, 1983). In organizations featuring a high level of supportive organizational climate, employees also tend to be quicker to capture resources and information to meet their needs based on the external stimuli associated with decent work, and such employees can internalize those resources into promotion focus more effectively (Khalili, 2016; Kim et al., 2021).

It is well known that the principle of reciprocity is a core concept of SET (Blau, 1968). When employees perceive strong support from the company, they reciprocate by engaging in positive behavior (Eisenberger et al., 1986; Lee, 2022). According to SET, if employees perceive strong support and care from the company in terms of the organizational culture and management system, they experience a higher degree of motivation (Akgunduz et al., 2022; Jung et al., 2021; Raza et al., 2023). Furthermore, internalizing promotion focus more strongly increases employees' perception of competency and their commitment to the organization, which in turn motivate them to engage in boundary-spanning behavior (Byron et al., 2018; Eisenberger et al., 1986; Sacramento et al., 2013). Therefore, since a supportive organizational climate represents a core resource for and psychological link in the relationship between companies and employees, this study argues that such a climate can moderate the relationship between decent work and promotion focus, which then has an interaction effect on employee boundary-spanning behavior.

According to empirical studies, when employees perceive a high level of support from the organization in terms of the management system and corporate culture, their understanding of situational stimuli deepens, and they exhibit a higher level of motivation (Liu et al., 2022; Senbeto et al., 2022; Zhang et al., 2021). Such employees are more confident and eager to engage in positive behaviors in return for the trust placed in them by the company (Alfes et al., 2013; Han et al., 2016; Huai et al., 2023; Liu et al., 2022). In a supportive organizational climate, employees have the confidence necessary to perform challenging work because they perceive that they are given the autonomy to make decisions and that the organization is more tolerant of their mistakes in the work process (Alfes et al., 2013; Hayat & Afshari, 2021). Therefore, the author argues that a supportive organizational climate, as an important conditioned resource, helps reinforce the positive impact of the situational stimulus of decent work on promotion focus. Specifically, for employees with low-level perceptions of decent work, psychological resource depletion and emotional exhaustion can lead to low motivation to work (Usman et al., 2023; Zhang et al., 2023). However, the moderation of a high degree of supportive organizational climate can mitigate the negative effects of negative social prestige and professional stereotypes on employees' positive psychological states (Khalili, 2016; Kim et al., 2021; Luthans et al., 2008). Therefore, in this context, employees are willing to adapt to the workplace and social environment, such as by overcoming a lack of internal drive and exhibiting a degree of promotion focus. For employees with high-level perceptions of decent work, this situation itself helps stimulate a spirit of adventure and exploration, which has a strong "empowering" effect (Sheng & Zhou, 2023). It is easier to encourage such employees to develop promotion focus with the help of a supportive organizational climate (Wang et al., 2014). Accordingly, this study proposes the following hypothesis:

H4. A supportive organizational climate positively moderates the relationship between decent work and promotion focus. That is, the stronger the supportive organizational climate is, the stronger the positive effect of decent work on promotion focus.

In light of the analysis and hypotheses discussed above, it is evident that promotion focus plays a mediating role in the relationship between decent work and employee boundary-spanning behavior

and that a supportive organizational climate positively moderates the relationship between decent work and promotion focus. It can further be inferred that the mediating role of promotion focus may be influenced by a supportive organizational climate. Specifically, when a tourism company has a strong supportive organizational climate, employees receive more instrumental and emotional resources and feedback from the organization based on reciprocal norms that also elicit a stronger sense of professional mission and organizational identity (Caya & Mosconi, 2023; Schneider & Reichers, 1983). Thus, even in a context in which decent work is low, a supportive organizational climate can compensate for the loss of emotional and psychological resources due to low-quality work, motivate employees to optimize environmental cognitive outcomes to fit organizational requirements, and increase the probability of employee boundary-spanning behavior (Caya & Mosconi, 2023; Khalili, 2016; Kim et al., 2021). Employees with high-level perceptions of decent work have richer conditional resources, and in situations featuring an improved supportive organizational climate, such employees can receive more resources, experience more emotional support, and perceive more self-efficacy and job autonomy (Blustein et al., 2023; Sheng & Zhou, 2023; Zhang et al., 2023).

This situation can satisfy the individual's intrinsic needs for autonomy, relationships, and competence, motivating them to increase their promotion focus and to be more willing to engage in employee boundary-spanning behavior (Braganza et al., 2021; Maggi & Vroegop, 2023). Accordingly, this study creates a research model based on the constructive principles of the moderated mediation model and proposes the following hypothesis (Edwards & Lambert, 2007):

H5. A supportive organizational climate positively moderates the mediating effect of promotion focus on the relationship between decent work and employee boundary-spanning behavior. That is, the stronger the supportive organizational climate is, the stronger the mediating effect of this mechanism.

Figure 1 summarizes the relationships included in our research model.

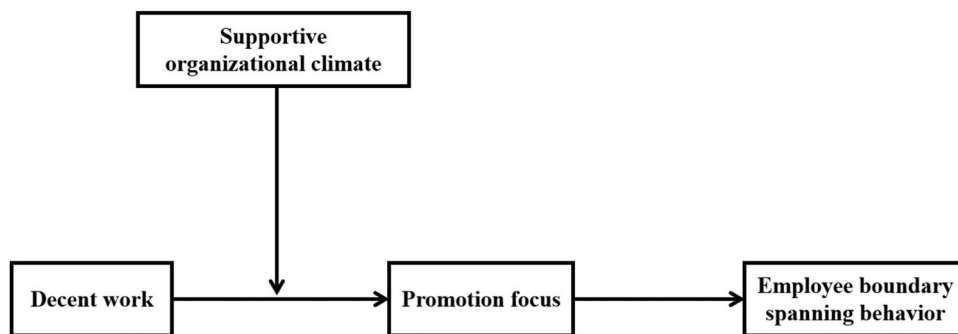

Figure 1. Research model.

3. Methodology

3.1. Sample and procedures

This study employed questionnaires to obtain data from frontline employees of hotels, tourist attractions, travel agencies, and tourism planning companies. Before the start of the research, the researcher communicated with the head of human resource management of the abovementioned companies to clarify the implementation process and the basic principles of the research. The survey was conducted using a combination of online and offline approaches (the online survey was directed by the head of human resources of tourism enterprises) and included a pretest and a formal survey. To improve the accuracy of the survey data and mitigate the impact of social approval bias, before the research subjects were allowed to complete the questionnaire, we explained to them the purpose of the survey and the appropriate precautions for completing the questionnaire. We also ensured them of the confidentiality of the questionnaire to address their psychological worries in further detail and encouraged them to answer the questions according to their true feelings as much as possible. Accordingly, prestudy respondents and experts were asked to highlight unclear or ambiguous content in the questionnaire, and subsequently, the final scale was gradually optimized based on the results of the principal component analysis and feedback obtained from the research respondents.

An online research approach was used for the pretest. Participants in the pretest included frontline employees from 3 hotels, 1 tourist attraction, 2 travel agencies and 2 tourism planning companies. The purpose of the presurvey was to test the validity of the questionnaire items. The presurvey started on July 3 and lasted for 9 days. The results of the analysis

proved that the overall scientific validity of the questionnaire with regard to each variable was high. During the formal research process, we recruited frontline employees of 7 hotels, 5 tourist attractions, 3 travel agencies, and 3 tourism planning companies as research subjects. The respondents were not the same as those included in the pretest. To minimize the negative impact of common methodological biases on the results of the study, a two-stage questionnaire was used. A combination of online and field research was used to collect data. Online research was conducted through a leading market research website in China (www.wjx.cn). The first phase of the research began on July 26, 2022, and lasted a total of 16 days. The questionnaires distributed in this phase included three elements: basic personal information, decent work, and employee boundary-spanning behavior. The second phase began August 30, 2022, and lasted a total of 11 days, during which questionnaires on promotion focus and a supportive organizational climate were administered. Both the online and the offline research required subjects to provide the last six digits of their cell phone numbers, which made it easier for us to organize the data. When processing the online questionnaires, only questionnaires that had been completed carefully (as verified by the inclusion of simple calculation questions and common sense questions in the questionnaire) and in a reasonable amount of time (4–10 min) were identified as valid samples. With regard to the offline questionnaires, we then excluded questionnaires that exhibited clear signs of regularity or many missing answers. Ultimately, 492 questionnaires were distributed across the two phases, and a total of 346 valid questionnaires were retained, for an effective response rate of 70.3%. In the sample of valid questionnaires, 69.7% of the

respondents were female, while 30.3% were male; in addition, most participants were 21–30 years old (53.2%), and a total of 64.2% of respondents were studying at university or had obtained a university degree. More than half of the employees had 1–5 years of work experience (55.5%), and they worked mainly in hotels (16.5%), scenic spots (23.1%), travel agencies (31.8%), and tourism planning companies (23.1%).

3.2. Measures

The instruments used in this study included measures of decent work, employee boundary-spanning behavior, promotion focus, supportive organizational climate and control variables. According to the suggestions of Brislin (1980), the correctness and equivalence of the concepts in the Chinese and English versions were confirmed. Therefore, all the items included in the questionnaire were translated into English and then back-translated into Chinese by two bilingual translators. With the exception of the control variables, all questionnaires were scored on a 5-point Likert scale, in which scores of one to five indicated a range extending from strongly disagree to strongly agree.

3.2.1. Decent work

The scale used to measure decent work was adapted from the questionnaire scale developed by Liu and Xu (2021) based on the connotation structure and indicator system of decent work. In this paper, frontline employees' subjective perceptions of decent work in the workplace were measured in terms of work environment, social status and career development, and a total of eight measurement items were included. A sample item is "My work can generally be recognized and respected by the community". The Cronbach's α of the scale is 0.907. A higher score indicates that frontline employees perceive a higher degree of decent work.

3.2.2. Employee boundary-spanning behavior

By reference to the scale developed by Marrone et al. (2007), a total of 5 item entries were designed. A sample item is "I will actively seek information, customers and other resources to promote the development of my organization". The Cronbach's α of the scale is 0.864. A higher score indicates that frontline employees engage in a higher degree of boundary-spanning behavior.

3.2.3. Promotion focus

By reference to the promotion focus section of the work regulatory focus (WRF) questionnaire developed by Neubert et al. (2008), a total of five measurement items were designed. A sample item is "I focus on completing my work assignments to achieve a higher level of job satisfaction". The Cronbach's α of the scale is 0.878. A higher score indicates that frontline employees perceive a higher degree of promotion focus.

3.2.4. Supportive organizational climate

Based on the job crafting scale developed by Luthans et al. (2008), a 7-item scale was modified for use in this study. A sample item is "Department heads support and assist their subordinates in achieving their work objectives". The Cronbach's α of the scale is 0.907. A higher score indicates that frontline employees perceive a higher degree of supportive organizational climate.

3.2.5. Control variables

Previous studies have reported that background variables have important effects on research (Schaufeli & Bakker, 2003; Sonnentag, 2003). According to the suggestions of scholars (Chi et al., 2018; Wang & Wang, 2017), this paper included demographic variables such as gender, age, education level, enterprise type and years of work experience as control variables in the analysis to mitigate the impact of demographic variables on the results of this study and thus ensure the scientificity and validity of the conclusions.

4. Results

4.1. Common method variance (CMV)

CMV bias was minimized in our study by distributing the questionnaires at multiple time points and by mitigating ambiguity among the included items (Podsakoff et al., 2012). Subsequently, Harman's test was used to detect possible CMV in the research model (Podsakoff et al., 2003). All items were subjected to exploratory factor analysis using principal component analysis with varimax rotation for detection. The results show that the first principal component can explain 30.1% of the total variance, i.e. no more than 50% of the total. Therefore, CMV is not a major concern in this study.

4.2. Reliability and validity tests

Confirmatory factor analysis (CFA) was conducted using AMOS 26.0 software to examine the convergent validity of each construct (Table 1). With regard to other competing models, the four-factor model clearly exhibited the best fit ($\chi^2 = 424.527$, $df = 269$, $\chi^2/df = 1.578$, $RMSEA = 0.041$, $TLI = 0.964$, $CFI = 0.968$, $SRMR = 0.054$, $GFI = 0.914$). This study thus confirmed that all factors included in this model exhibited a high degree of internal consistency. Moreover, the standard factor loadings of the items were all above 0.5, the average variance extracted (AVE) of each construct ranged from 0.555 to 0.603 (>0.5), and the composite reliabilities (CR) ranged from 0.871 to 0.909. The composite reliabilities of each construct were over 0.7, suggesting acceptable convergent validity. Thus, the model exhibited both convergent validity and discriminant validity (Fornell & Larcker, 1981).

4.3. Descriptive analysis

The means, standard deviations and correlation matrix of all variables are shown in Table 2. Decent work is significantly positively related to employee boundary-spanning behavior ($r = 0.508$, $p < 0.001$),

promotion focus ($r = 0.464$, $p < 0.001$) and supportive organizational climate ($r = 0.335$, $p < 0.001$). Furthermore, employee boundary-spanning behavior is significantly positively associated with promotion focus ($r = 0.524$, $p < 0.001$) and a supportive organizational climate ($r = 0.319$, $p < 0.001$). Moreover, promotion focus is significantly positively related to a supportive organizational climate ($r = 0.312$, $p < 0.001$). Therefore, the results of the descriptive analysis lay a good foundation for the follow-up test.

4.4. Hypothesis testing

First, hierarchical regression analysis was used to test the main effect and the mediating effect of promotion focus. Subsequently, the hypotheses were tested separately; the results are shown in Table 3. Model 5 shows that the direct effect of decent work on employee boundary-spanning behavior ($\beta = 0.513$, $p < 0.001$) is significant. These results support H1. Model 2 shows that decent work has a significant positive effect on promotion focus ($\beta = 0.442$, $p < 0.001$) when the independent variables are included in the regression model while controlling for demographic variables; thus, H2 is supported. In the preliminary test of the mediating effect, Models 5 and 6 show

Table 1. CFA results.

that the coefficient of decent work on employee boundary-spanning behavior ($\beta = 0.344$, $p < 0.001$) decreases after the mediating variable promotion focus is included in the regression equation. At this time, promotion focus has a significant positive effect on employee boundary-spanning behavior ($\beta = 0.347$, $p < 0.001$). This finding suggests that promotion focus partially mediates the effect of decent work on employee boundary-spanning behavior; thus, the results of this analysis support H3.

Second, this paper used the bootstrap method to test the mediating effect of promotion focus in depth (Preacher & Hayes, 2008); the results are shown in Table 4. The value of the indirect effect of decent work on employee boundary-spanning behavior via promotion focus is 0.177. The Monte Carlo result indicates that the 95% CIs for the distribution of the product of coefficients range between 0.127 and 0.233, not including 0. This finding also confirms the significant mediating role of promotion focus in the relationship between decent work and

Table 4. Results regarding the mediating effect.

Path	Effect	S.E.	95% CIs	
			LLCI	ULCI
Decent work $\rightarrow$ Promotion focus	0.510	0.053	0.406	0.614
Promotion focus $\rightarrow$ Employee boundary-spanning behavior	0.347	0.046	0.257	0.438
Decent work $\rightarrow$ Promotion focus $\rightarrow$ Employee boundary-spanning behavior	0.177	0.027	0.127	0.233

employee boundary-spanning behavior. Combined with the results of the previous hierarchical regression analysis, H3 is thus supported.

Finally, to verify the moderating effect of a supportive organizational climate, this research also used hierarchical regression analysis to confirm the relationships among the variables. Given that the test of the moderating effect involves interactions between regulatory variables and independent variables, the data on decent work and a supportive organizational climate were centralized, and

interaction terms were constructed and included in the regression model.

According to Model 3 in Table 3, the interaction term of decent work and supportive organizational climate has a significant positive effect on promotion focus ($\beta = 0.165, p < 0.01$). This finding suggests that a supportive organizational climate has a significant moderating effect on the relationship between decent work and promotion focus. Furthermore, according to the simple slope analysis proposed by Aiken et al. (1991), this study further analyzed the moderating effect of a supportive organizational climate. Accordingly, this study divided data regarding a supportive organizational climate into two groups: a highly supportive organizational climate (one SD above the mean) group and a less supportive organizational climate (one SD below the mean) group. Combined with the data test results, a moderating effect diagram was thus drawn. The slope graph shown in Figure 2 indicates that the effect of decent work on promotion focus is significantly stronger in the highly supportive organizational climate group, while the linear slope of the relationship decreases as the supportive organizational climate decreases. Therefore, H4 is further verified.

Based on the verification of H3 and H4, this study used the bootstrap method to test the moderated mediation model. This method verified that a supportive organizational climate can positively moderate the mediating effect of promotion focus on the relationship between decent work and employee

boundary-spanning behavior; the results are shown in Table 5. At a low level of supportive organizational climate, the indirect effect of decent work on employee boundary-spanning behavior via promotion focus is 0.100, and the 95% CIs for the distribution of the product of coefficients range between 0.099 and 0.237, not including 0. When the supportive organizational climate is at a high level, the indirect effect of decent work on employee boundary-spanning behavior via promotion focus is 0.207, and the 95% CIs for the distribution of the product of coefficients range between 0.143 and 0.283, not including 0, thus reaching the level of significance. More importantly, the difference between the two groups is 0.107, and the 95% CIs for the distribution of the product of coefficients range between 0.07 and 0.191, not including 0. Therefore, the difference between the groups is also significant. These findings suggest that the indirect role of promotion

Table 5. Results regarding the moderated mediation effect.

Variables	Promotion focus			
	Estimate	S.E.	95% CIs	
Low level of supportive organizational climate (M-1SD)	0.100	0.028	0.045	0.156
High level of supportive organizational climate (M+1SD)	0.207	0.035	0.143	0.283
Difference	0.107	0.039	0.037	0.191

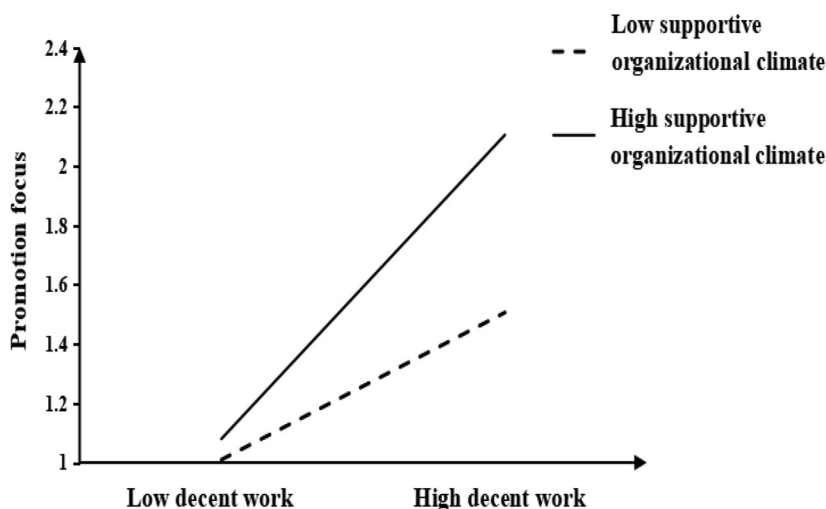

Figure 2. Moderating effect diagram.

focus in the overall mechanism is more obvious in tourism firms with a more supportive organizational climate; thus, H5 is supported.

5. Discussion

5.1. Summary of findings

Focusing on the Chinese organizational context and cultural background, this paper explored the mechanism underlying the effect of decent work on the boundary-spanning behavior of frontline employees based on the SDT and SET perspectives. Moreover, after the introduction of the notions of promotion focus and a supportive organizational climate, a systematic analysis was conducted by constructing a moderated mediation model, and the following conclusions were drawn after empirical testing. (1) Decent work has a significant positive effect on employee boundary-spanning behavior. (2) Promotion focus partially mediates the relationship between decent work and employee boundary-spanning behavior. (3) A supportive organizational climate has a significant moderating effect on the relationship between decent work and promotion focus. As the degree of supportive organizational climate increases, the positive relationship between these two factors becomes stronger. (4) A supportive organizational climate significantly moderates the mediating effect of promotion focus. That is, the stronger the supportive organizational climate is, the stronger the mediating effect.

5.2. Theoretical implications

First, in the field of tourism management research, scholars have begun to pay attention to boundary-spanning behavior from the perspectives of working situational factors, such as leadership behavior patterns, organizational structure and high-performance work practices (Karatepe et al., 2014; Leifer & Huber, 1977; Li et al., 2012; Marrone et al., 2022). However, previous studies have not focused on the occupation of frontline tourism employees with the goal of analyzing the process by which employees respond to their situations by engaging in boundary-spanning behavior from the perspective of individuals' intrinsic needs. Responding to Blustein et al. (2023) and Sheng and Zhou (2023), we introduce decent work, as an element of psychological demand, into the tourism context and explore the mechanism underlying its

effects on the behavior of employees. Accordingly, this study introduces the notion of decent work as an important contextual factor for exploring the mechanism by which employee boundary-spanning behavior emerges in the tourism industry, and the results confirm the positive relationship between these two factors. The results of this research are consistent with the findings of Wong et al. (2010) as well as those of Wang and Chen (2018), who focused on the fact that the dynamic relationship between decent work and employees' behavioral responses must be explored in the Chinese context. Therefore, the findings of this study significantly expand the theoretical boundaries of the factors influencing frontline employee boundary-spanning behavior as well as the scope of boundary-spanning behavior in the tourism context. In addition, these findings explicate the "black box" of the influence of decent work on employee boundary-spanning behavior.

Second, the emergence of employee boundary-spanning behavior is not the direct effect of situational factors but rather the result of the interaction effect of the situational factor of decent labor and individual traits (Deci et al., 2001; He et al., 2022). The present study appeals to the ideas of Marrone et al. (2007) by focusing on the causal chain of "environmental factors-intrinsic psychological needs-individual behavior". Therefore, this paper introduces the mediating variable of promotion focus, thus providing a new and effective analytical framework for the mechanism underlying the relationship between decent work and the boundary-spanning behavior of frontline employees in the tourism industry. This study thus responds to the call for further research on the drivers of employees' boundary-spanning behavior, and its findings deepen the exploration of the mechanisms mediating the relationships pertaining to the main effect (Deci et al., 2001; Nguyen et al., 2022; Yoo et al., 2014). Previous studies have put more emphasis on the impacts of a supportive organizational climate on employees' psychological and behavioral responses (Alfes et al., 2013; Deci & Ryan, 2000; Wang et al., 2014). The moderating effect of a supportive organizational climate on the relationship between decent work and the promotion focus has not been studied. Furthermore, research regarding the effects of decent work on employee psychology and behavior from a reciprocal SET perspective is lacking. To address this gap, this research identifies a supportive organizational climate as a positive aspect of employee resources and confirms

its positive moderating role in the relationship between decent work and promotion focus. This approach enhances and improves the explanatory and predictive power of the mechanism underlying employee boundary-spanning behavior, echoing the view of triadic reciprocal determinism (Bandura, 2001).

Third, previous research has focused on analyzing the mechanisms associated with decent work based on SDT or SET (Akgunduz et al., 2022; Blustein et al., 2023; Jung et al., 2021; Nguyen et al., 2022; Raza et al., 2023; Wang et al., 2022). As Sweet et al. (2012) argued, it is difficult for a single theory to explain systematically the mechanisms that generate employee behavior, especially with regard to theoretical models including moderating factors. Focusing on the Chinese organizational context and cultural background, this paper systematically integrates SDT and SET to explore the mechanisms underlying the influence of decent work on frontline employee boundary-spanning behavior. This mode of analysis can compensate for the poor results of previous studies that have relied on only one theory for analysis. Supported by SDT and SET, this study incorporates the individual trait factor of promotion focus as well as the organizational factors of decent work and a supportive organizational climate, thereby scientifically validating the research hypotheses from the perspective of cross-level interactions. This approach also responds to the call from the academic community to expand the research on the drivers of employees' cross-border behaviors (Lee & Han, 2020; Marrone et al., 2022; Wang, Fu, & Wang, 2021; Wang, Fu, Wang, & Wei, 2021). Therefore, the findings not only help to deepen our exploration of the mechanism underlying the relationships pertaining to the main effect but also extend the scope of the combined application of SDT and SET, which effectively complements the results of previous research. The conclusions not only help to deepen the discussion regarding the mechanism underlying the relationships pertaining to the main effect but also extend the scope of the combined application of SDT and SET, thus effectively supplementing the results of previous research.

5.3. Practical implications

First, it is clear that decent work contains features that promote workers' basic rights, recognition of their own value, and acquisition of human dignity,

thus contributing to the fact that frontline employees in the tourism industry exhibit a stronger promotion focus that can stimulate employee boundary-spanning behavior. Decent work is a key way of depersonalizing frontline service work in the context of tourism, thereby eliminating the stereotypes and negative social reputation associated with the profession, which can help solve the fundamental problems of economic transformation and innovation development in the tourism industry at the micro level. Therefore, tourism enterprises should improve the level of decent work they provide to employees with regard to all aspects of the organizational system, work content and social value assessment. In terms of the construction of the organizational system, enterprises should focus on ensuring fairness and equity as well as providing institutional protection with regard to matters such as occupational safety and career development. For example, tourism enterprises should establish more binding labor contracts in accordance with the law to protect the occupational safety of their employees. They should also be open and transparent with regard to promotions, rewards and penalties. In terms of work content, companies should focus on inclusion and communication, thereby providing opportunities for employees to participate in decision-making. For example, before implementing important initiatives, companies should solicit suggestions from all employees and take them seriously. In this way, employees can truly be aware of their own value and experience joy in their work. In addition, companies should also focus on the social evaluation of tourism careers. Thus, companies can promote the value of labor equality, encourage frontline service, change the traditional imbalance between customers and frontline employees in their interactions due to cognitive bias, and prevent grassroots services from continuing to represent a physical and mental "burden" on frontline employees in the tourism industry. On this basis, companies and society should realize that promoting decent work is not only an investment but also a form of "empowerment" aimed at improving the culture of society. This approach offers an incentive for frontline employees to work with tourism companies for mutual benefit, and improving employee service quality also has significant positive effects on the benefits provided to tourists and the formation of a quality tourism service culture.

Second, the study finds that promotion focus positively influences employee boundary-spanning behavior and partially mediates the relationship between decent work and employee boundary-spanning behavior. These findings suggest that the development of promotion focus motivates employees to pursue the goals of achievement and growth, encouraging them to take the initiative to improve their work status and engage in boundary-spanning behavior. Therefore, tourism companies must recognize that employees' promotion focus can be facilitated through effective cultivation; accordingly, such companies must actively guide frontline employees to develop a high level of promotion focus, thereby stimulating their self-development awareness and achievement-oriented enhancement as well as establishing a positive promotion culture within the organization. For example, tourism companies can focus on this personality trait during the employee recruitment process. In the process of employee training, managers should pay attention to this personality attribute. In the course of their work, companies must provide such employees with moral and material incentives to motivate them to improve their performance. In reality, tourism companies can use words, symbols and other cultural elements to stimulate the values and target expectations of frontline employees or create an attractive and appealing organizational vision to encourage employees to pay attention to organizational development and strengthen their own capabilities. In addition, managers should also play a positive role by serving as role models, thereby instilling in employees values associated with promotion focus such as those pertaining to progress, ideals and growth, striving to advocate the pursuit of higher performance goals and achievements, and implementing a positive feedback mechanism in the workplace. In this way, employees can maintain a highly positive work ethic and become aware of their own self-worth.

Finally, this study shows that a supportive organizational climate is a "catalyst" for the relationship between decent work and promotion focus and an "enabler" of the mediating effect of promotion focus on the relationship between decent work and employee boundary-spanning behavior. Even in low-level decent work situations, a high level of supportive organizational climate can effectively mitigate the resource drain caused by negative environmental perceptions on employees' psychological state. This finding can inspire tourism companies to emphasize

the importance of a supportive organizational climate for organizational and employee development, thereby giving employees psychological cues indicating that they are trusted and valued in the workplace and motivating them to overcome situational stresses, increasing their self-confidence and continually encouraging them to move forward. Managers must also provide sufficient opportunities and resources for frontline employees, such as by creating a free, harmonious and soft environment, giving employees the opportunity to show their opinions and ideas, and even increasing their autonomy through appropriate authorization. For example, when an employee makes a service error, the manager should not simply blame the employee or take punitive measures. Companies should be more tolerant of employees and recognize their dedication to the company. Managers should pay attention to the suggestions and ideas proposed by employees and encourage them to make positive suggestions. In addition, it is necessary to strengthen the construction of cultural transfer mechanisms, such as by encouraging knowledge sharing, enhancing communication among employees, creating harmonious and stable interpersonal relationships, and promoting subjective initiative, which can also help stimulate employee boundary-spanning behavior.

5.4. Limitations and directions for future research

First, the measures of most variables included in the theoretical model were drawn from foreign scales; however, the cross-cultural applicability of these scales is questionable. Therefore, in the future, more applicable scales should be developed based on localized Chinese contexts to perform follow-up tests of the hypotheses.

Second, all data were obtained from frontline employees' self-assessments. Employees may have reservations about or conceal their true situations, in turn affecting the accuracy and reliability of the data. Subsequent studies should draw on multiple sources to obtain data. For example, matching research on leaders and employees should be conducted to facilitate comprehensive measurement, thereby effectively reducing measurement error and ensuring that the research results are more scientific.

Third, although this study quantitatively analyzed the relationship between decent work and employee boundary-spanning behavior in the tourism industry,

Rihova et al. (2018) noted that individuals' cognitive and behavioral responses to situational factors are based on their own social constructs and evaluations. While semistructured interviews can reveal employees' cognitive and behavioral responses more systematically, subsequent studies should incorporate qualitative research methods and combine them with quantitative research to elucidate the mechanism underlying the main effect through the joint use of these methods.
