Abstract

Purpose – The purpose of this study is to evaluate the recognition of sexual harassment (SH); to describe the relationships among SH, employees' burnout, customer-oriented boundary-spanning behaviors (COBSB); and to verify the moderating effect of employees' psychological safety (PS), all within deluxe hotels in South Korea.

Design/methodology/approach – Prior to verifying the hypotheses, reliability and confirmatory factor analysis were managed, and correlation analysis was used to confirm the directionality between the hypotheses. The hypotheses were analyzed using a structural equation model and multi-group analysis was used to analyze the moderating effect.

Findings – Perceived SH was significantly related to employees' burnout and COBSB. Also, the employees' burnout was significantly related to COBSB. The moderating effect was significant; low PS greatly increased relative to the effects of SH on COBSB.

Originality/value – All types of companies consider unethical behaviors, such as SH in the workplace, as crucial problems that degrade the individual quality of life, and some firms have devised active measures to prevent and relieve damages. Companies should implement employee-centered policies that enable employees, the victims, to formally report and testify to what they have suffered from without revenge from their assailants. All the factors that contribute to the institutional control of SH within the working environment should be taken into consideration, and strict standards should be applied on a company level by criminalizing such behaviors. Employees should be trained on how to effectively cope with diverse types of SH.

Keywords Sexual harassment, Burnout, Customer-oriented boundary-spanning behavior, Psychological safety, Deluxe hotel

Paper type Research paper

Introduction

Sexual harassment (SH) triggers unique and particular problems within an organization: it lowers the quality of the organizational lives of female employees, builds obstacles that disable employees from fully immersing themselves in their organization, and creates additional special costs to the organization (McDonald *et al.*, 2011). Among the different types of collective harassment that occur within an organization, SH is insidious because it has a tremendous influence on the health hazards of employees. The problem is particularly

noticeable in women and sexual minorities (Ménard *et al.*, 2010). Numerous research studies have noted the negative relationship between SH and an organization's macroscopic performance (Clarke *et al.*, 2016; Salman *et al.*, 2016). Given the numerous harmful influences of SH, the issue requires a profound examination and serious consideration within organizations (Merkin and Shah, 2014). In this study, the researcher focused on the premise that SH regularly occurs within an organization because assailants have greater power than victims, rather than SH being an example of corrupt power (Maypole, 1987).

In particular, workplace harassment in deluxe hotels is much more prevalent than in ordinary companies (Hsu *et al.*, 2019; Vettori and Nicolaides, 2016) due to job characteristics, such as antisocial working hours, low income and emotional labor occurring in service encounters with customers (Eller, 1990; Pratten and O'Leary, 2007). The frequency of employees' contact with customers is high and this increases their exposure to SH (Weber *et al.*, 2002). A lot of hotels are indifferent to SH of their employees (Ineson *et al.*, 2013). Nonetheless, research on deluxe hotels has not been sufficiently conducted in experiential terms. The research on some ordinary companies has merely explored the actual situations of SH (Jayapalan *et al.*, 2018; Merkin and Shah, 2014; Laband and Lentz, 1998), and the research on relationships among the perception levels of SH and employees' behaviors and of institutional factors that affect their behaviors is relatively insufficient. In particular, according to the cultural dimensions theory by Hofstede (1989) and McSweeney (2002), Korea has cultural characteristics of relatively strong power distance, collectivism and masculinity. As a result, managers' power is easily acknowledged, a sense of solidarity between groups is high, and the roles of men and women are obviously differentiated, and therefore, women may be more readily exposed to workplace harassment.

In this regard, this study used customer-oriented boundary-spanning behaviors (COBSB) as the ultimate dependent variable. COBSB represent in-role and out-role behaviors that employees should display to their customers and includes voluntary behaviors (Bettencourt *et al.*, 2005). Moreover, as employees' behaviors are easily affected by organizational unjustness, such as workplace harassment (Li *et al.*, 2016), this research on the relationship between SH and COBSB (as extra-role behaviors of employees) is timely. Therefore, considering that the attitudes or behaviors of frontline employees who provide customer services at the closest encounter have a significant spillover influence on customer responses (Chi and Gursoy, 2009), it should be meaningful to examine customer-oriented boundary-spanning employees' pro-social behaviors (Alexander *et al.*, 2016; Teng and Chang, 2013). In addition, psychological safety (PS) is used as a moderating variable with a common belief that employees were safe in their relationship with other members of their organization (Edmondson, 1999). When employees have high PS in relation to their organization, they can deal flexibly with the bullying that occurs within their workplace, and their organization's support of their PS decreases the impact of the perceived SH (Estrada *et al.*, 2011). In organizational terms, the results of this study should provide realistic suggestions. Therefore, this study aims to address the following activities:

- investigate the influence of SH on employees' burnout and COBSB;
- verify the influence of burnout on COBSB; and
- investigate the moderating effects of employees' PS in deluxe hotels.

Theoretical background

Sexual harassment and hospitality industries

Most research using the keyword of SH in the hospitality industry is confined to the actual conditions of SH, and the relevant research is described as follows. Worsfold and McCann

(2000) observed that in comparison to the men, the women of the lower class were much more frequently exposed to SH from both their colleagues and their superiors. The reason is that harassment is committed on those whose position or power is weaker than the assailants. Weber *et al.* (2002) noted that SH among restaurant employees was on the rise, and situations that may have been interpreted as SH have not been perceived as such. Although men and women did not differ in their perceptions about SH, employees in the restaurant industry were more exposed to it. Poulston (2008) maintained that 24.3 per cent of the employees in the hospitality industry of New Zealand had undergone SH and that it was mostly committed by their colleagues. Theocharous and Philaretou (2009) noted that the short-term negative outcomes of SH included decreased income, economic threats and losses, loss of jobs and layoffs and that longer-term SH contributed significantly to a loss of self-confidence and to the decline of physical and psychological health. Mkono (2010) additionally asserted that hotel policies were inadequate for dealing with SH, and as a result, employees were exposed to SH from a range of types of people in their work environment, including colleagues, customers and managers. Ineson *et al.* (2013) observed that employees who perceived SH encountered a psychological dilemma, facing negative emotions such as threats, fear and humiliation, and the authors warned that most hotels failed to establish effective management policies. Ali *et al.* (2016) found that the SH that employees experience in a deluxe hotel negatively influences their productivity, employment and emotions. Li *et al.* (2016) further asserted that when employees in the hospitality industry perceived SH, such perception decreased their enthusiasm and discouraged their positive customer service behaviors. Vettori and Nicolaides (2016) conducted a conceptual analysis to solve the issue of SH and legal issues related to it in the hospitality industry of the Republic of South Africa. Similarly, the research on SH in the hospitality industry and hotels has been mainly confined to research on the actual conditions of SH or examinations of its association with negative performance.

Sexual harassment and burnout

Burnout is a condition of physical, mental and emotional fatigue; it means that the employees' energy has been exhausted and that they have become frustrated (Schaufeli *et al.*, 1994). Savicki *et al.* (2003) similarly asserted that a variable to predict employees' burnout was SH. Cortina and Berdahl (2008) noted that women more severely complained of the side effects of SH than men, and they added that women were more likely to be exposed to stress or burnout resulting from such SH. Hanson *et al.* (2015) observed that both SH and sexual aggression had a positive correlation with employee burnout and that experiencing such types of violence in their workplace was closely related to employees' fears and their resulting negative health. Liu *et al.* (2018) observed that workplace violence, including SH, had a great influence on increasing nurses' burnout. Livne and Goussinsky (2018) argued that employees who had undergone SH had a high level of burnout. Takeuchi *et al.* (2018) also noted that SH experienced by employees in an organization increased their burnout and that those with a high level of burnout were much more exposed to such harassment:

H1. Perceived SH is positively related to employees' burnout.

Burnout and customer-oriented boundary-spanning behaviors

The concept of COBSB encompasses customer-centered behaviors that have a high likelihood of employees' roles being regarded as prescribed and voluntary behaviors that should lead them to perform beyond their roles (Bettencourt *et al.*, 2005; Mollahosseini *et al.*, 2012). More

specifically, COBSB includes external expressions, internal influence and service provision. External expressions are the degree of the employees' expression on the images, goods and services of their organization to their customers, such that they can significantly support such images, goods and services. Internal influence is the degree of the individual employee's contribution when communicating with their company and colleagues regarding methods to improve service provision by their organization, colleagues and themselves. Service provision is the degree of delivering services to consumers in a sincere, adaptable and courteous method (Bettencourt *et al.*, 2005). In the relevant previous research, Singh *et al.* (1994) verified a negative relationship between service employees' burnout and their service boundary behaviors. Fu (2013) noted that service employees' burnout decreased their customer-oriented behaviors. Also, Rod and Ashill (2015) observed that employees' burnout, such as psychological exhaustion, has an extremely negative effect on the customer-oriented behaviors of employees. Also, Elmadağ and Ellinger (2018) asserted that when stress-like burnout increased, employees' customer-oriented behaviors decreased. Therefore, we propose that burnout reduces hotel employees' COBSB, leading to the following hypothesis:

H2. An employee's burnout is negatively related to that employee's COBSB.

Sexual harassment and customer-oriented boundary-spanning behaviors

Most of the research related to SH and employee behaviors has concluded that perceived SH increases negative behaviors, such as counterproductive work behaviors (Gruys and Sackett, 2003; Ones, 2018), employees' stress (Hutagalung and Ishak, 2012) and turnover intent (Gutek and Koss, 1993; Merkin and Shah, 2014; Salman *et al.*, 2016). However, the research examining the association between perceived SH and the positive behaviors of employees is very rare. In a study with hypotheses similar to those of this work, Li *et al.* (2016) additionally explained that perceived SH negatively influenced employees' customer-oriented service performance, and they observed that SH committed during abusive supervision negatively affected employees' customer-oriented organizational citizenship behaviors, which are intended to sincerely provide what the customers want. In addition, in a similar context of employees' voluntary behaviors, Mubarak and Mumtaz (2018) asserted that employees who experienced bullying in an organization had a low level of voluntary behaviors. Therefore, we propose the following hypothesis:

H3. Perceived SH is negatively related with employees' COBSB.

Moderating effects of psychological safety

PS may be defined as the common belief that an organization is safe against the risks related to interpersonal relationships (Edmondson, 1999). Accordingly, PS means the common belief shared by employees in a working environment where mutual respect is paid beyond the perception and experience of high-level interpersonal relationships (Walumbwa and Schaubroeck, 2009). Although we are not aware of any proceeding studies or theories connecting SH to PS or to COBSB, the arguments of this study that pertain to the connections between SH and these traits could be applied to connect them to these outcomes. Idris *et al.* (2014) asserted that PS is a very important variable that affects employees' psychological exhaustion, is able to predict the structure of the organizational climate, and has a significant influence in worsening their burnout. Hernandez *et al.* (2018) noted that employees' burnout negatively affects their PS. Nahrgang *et al.* (2011) also observed that employees without PS experience a very high level of burnout. Based on these results, PS is

considered to have a moderating effect in the relationship between *H4a* and *H4b*. Also, given that employees' enhanced PS increases their voice behaviors (Walumbwa and Schaubroeck, 2009) and has a positive relationship with their helping behaviors (Frazier and Tupper, 2016), employees are able to skillfully cope with harassment or negative treatment within their workplace when they obtain PS. In addition, Rai and Agarwal (2017) verified that when psychological contract is violated, it leads to an increased negative influence on employees, and the negative effect on their engagement from workplace harassment may be alleviated by their PS. Baker (2017) noted that employees' experiences with SH negatively affects their PS, and from similar perspectives, Rossiter and Sochos (2018) asserted that humane support by colleagues or supervisors decreases the influence of workplace violence on victims. Therefore, PS is high when an organization has reliable interaction with its employees, and the influence of perceived SH on their behaviors may decrease. Resultantly, the negative influence of SH on employees' COBSB and the positive influence of SH on their burnout are estimated to be reduced when PS is high. Figure 1 shows the conceptual model that was directed toward achieving these purposes:

H4a. PS moderates the effects of SH on burnout.

H4b. PS moderates the effects of burnout on COBSB.

H4c. PS moderates the effects of SH on COBSB.

Research methodology

Data collection and procedure

We collected data from deluxe hotel employees in hotels in Seoul, South Korea. Deluxe hotels were defined as five-star hotels with more than 200 rooms. Based on the 2017 hotel rating data by the Korea Tourism Organization, a total of 22 five-star hotels were selected. Among them, 10 hotels authorized the survey. The subjects were female employees working in these hotels. As mentioned in the introduction, the subjects were limited to women because numerous studies (Arnold *et al.*, 2011; Clarke *et al.*, 2016; Worsfold and McCann, 2000) have observed that female employees were more exposed than male counterparts to SH committed by their superiors or colleagues. Also, the percentage of female frontline employees is relatively high compared to other job groups. Moreover, considering that the

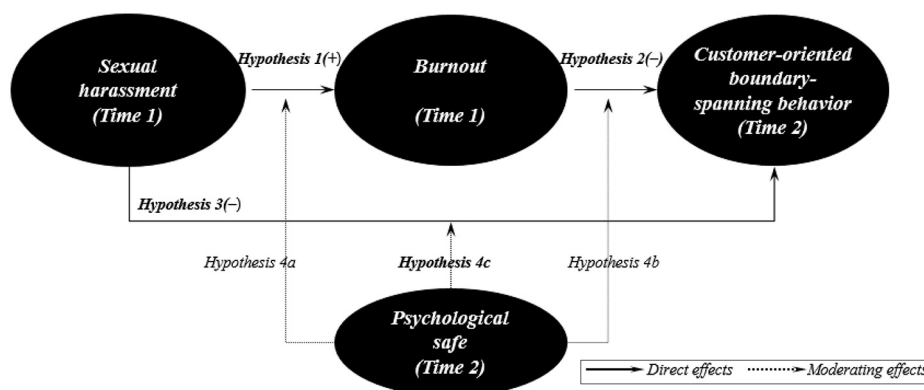

Figure 1.
Conceptual model

attitudes or behaviors of frontline employees who provide customer services at the closest encounter have a significant spillover influence on customer responses, it will be meaningful to examine the effect of banning employees' pro-social behaviors (Bettencourt *et al.*, 2005).

Prior to the survey, the researcher interviewed those in charge of human resource management in the deluxe hotels and explained the study purposes and procedures and the survey methods to them. The researcher acquainted the employees with the fact that the collected data would be used solely for this research and maintained as confidential. Because it was impossible to obtain consent from all employees, the researcher used convenience sampling. The researcher then conducted surveys on those who consented to voluntarily participate in them. The participants were instructed that they were able to cancel participation at any time after the survey was initiated and that there would be no disadvantage resulting from such cancellation. The surveys were conducted at two different time points to reduce respondents' tendency to maintain consistency and to avoid asking similar questions at the same time. This approach was also taken to minimize common method bias that may occur when a survey is conducted at the same time point. This was accomplished by dividing the measurement variables into the first round (SH and burnout) and the second round (COBSB and PS) (Podsakoff *et al.*, 2003).

The following method was applied to collect response data from other time points from the same sample. An identification (ID) number was provided to match each respondent's name. Then a survey was conducted at Timepoint 1, and the IDs of the samples with incomplete or careless responses among the collected questionnaires were deleted, and the rest were encoded. All the data were encoded and stored in the computer, and the encoded information was managed using codes so that only the researcher was able to look at it. The survey was initiated with an explanation of the study purposes, and all the respondents voluntarily participated in the survey. The respondents were repeatedly notified that the survey was being conducted anonymously. The survey at Timepoint 2 was carried out with questionnaires that matched the IDs at Timepoint 1. At Timepoint 1, a total of 452 samples were collected, and at the second time point, 416 samples were surveyed except for incomplete questionnaires. Completed surveys were received from 334 frontline employee participants, for a response rate of 66.8 per cent. In comparing the responses of the matched and the unmatched employees, no differences were found in any of the variables examined in this study. A total of 334 female frontline employees working in 10 deluxe hotels, were selected as subjects for this study. The median age was 25, and the majority of the subjects (65.2 per cent) reported "university" as their highest level of education. The median length of the subjects' employment was 4.3 years.

Instrument development

The questionnaires were prepared in the following way: to guarantee precision and conceptual homogeneity between the English and Korean versions, all the questionnaires were translated by a bilingual native speaker (Brislin, 1980) and then back-translated. According to a proposal by Adler (1983), back-translation may be appropriately conducted by one who knows the culture and language well. To check whether the content was valid, two research workers reviewed the translated items and identified and revised ambiguous expressions. Then, a preliminary survey of 50 frontline employees in a deluxe hotel was conducted; several questions were revised for clarity based on their feedback.

The questionnaire consisted of five sections: SH (independent variable), burnout (mediator), COBSB (dependent variable), PS (moderator) and control variables (Appendix). A seven-point Likert scale was used with all of the questionnaire items. A scale developed by Fitzgerald *et al.* (1995) and modified by Li *et al.* (2016) was used to measure SH perceived

by employees. As mentioned in the questions, this study confined SH to sexual seduction or verbal and physical behaviors corresponding to sexual seduction from superiors or colleagues in the workplace of the respondents. Burnout was measured with five questions, based on [Maslach and Leither \(2008\)](#) and [Schaufeli et al. \(1994\)](#). COBSB were measured with six questions, including questions on external representation, internal influence and service delivery behaviors based on research by [Bettencourt et al. \(2005\)](#). PS was evaluated with five questions based on research by [Edmondson \(1999\)](#). In addition, this study used age, education level and tenure as three control variables, and it controlled influence by each of the demographic variables. Because previous research verified that age ([Inness et al., 2005](#)) and tenure ([Wayne, 2000](#)) were closely related with workplace harassment, the researcher included such control variables in the final model, with the judgment that they may influence organizational behaviors.

Data analyses

The data were analyzed using the analysis of moment structures (AMOS) and statistical package for the social sciences programs. The two-step method ([Anderson and Gerbing, 1988](#)) was used to explore the reliability and validity of the measured constructs. Reliability and confirmatory factor analysis (CFA) were managed, and correlation analysis was used to confirm the directionality between the hypotheses. The hypotheses were analyzed using a structural equation model, and multi-group analysis was used to analyze the moderating effect. In addition, the bias-corrected bootstrapping method was used to verify the mediating effect ([Hooker and Mentch, 2018](#)).

Results

Measurement model

To evaluate the validity of the measurement items, we first demonstrated a CFA on four dimensions: SH, burnout, COBSB and PS. The results demonstrated that the four-factor model fit the data well ($\chi^2 = 504.991$; $df = 246$; $p < 0.01$; NFI = 0.888; TLI = 0.931; CFI = 0.939; RMR = 0.032). Also, the Cronbach's alpha demonstrated the internal consistency (>0.90). The validity of the measured items was divided into convergent validity and discriminant validity for verification. The evaluation standards for convergent validity ([Bagozzi and Yi, 1988](#)) were standardized factor loading ≥ 0.6 ($p < 0.001$), average variance extracted (AVE) ≥ 0.5 and composite construct reliability ≥ 0.7 . All the potential factors used in this study were found to satisfy this standard ([Anderson and Gerbing, 1988](#)). In addition, the lowest AVE value (0.527) and the squared value of correlation among all the potential factors (0.016 to 0.121) were compared; the result of the AVE value was found to be much greater, and therefore, the discriminant validity was verified ([Table II](#)). Moreover, the average shared variance (ASV) and the maximum shared variance (MSV) calculated were smaller than AVE; accordingly, validity was obtained. Therefore, the measurement model was considered adequate to proceed with hypotheses tests using AMOS software.

The common method bias (CMB) was judged to be relatively small because the surveys were conducted at different time points. Nevertheless, the researcher additionally conducted Harmon's single factor test to verify that the CMB error was small ([Podsakoff et al., 2003](#)). The result of conducting the analysis to resolve the CMB was that the per cent of factor 1 (29.567 per cent) was significantly low in comparison with the total explanatory variance (68.211 per cent), verifying that not measuring all of the variables at the same time point was not a material matter ([Tables I and II](#)).

Structural equation model testing

Prior to verification of the hypotheses, the correlation among independent variables, parameters, moderating variables and dependent variables was verified. Correlation of all the variables was the same as predicted (Table II). In addition, a variance inflation factor test was conducted so that regression analysis was not biased by multicollinearity, and the result was that the critical threshold was smaller than 10 (Cohen *et al.*, 2003).

The standardized coefficient estimates for the structure equation model (SEM) are presented in Table III. The SEM fit was appropriate ($\chi^2 = 306.610$; $\chi^2/\text{df} = 2.058$; GFI = 0.912; NFI = 0.918; CFI = 0.956; TLI = 0.949; RMSEA = 0.056; RMR = 0.034). Perceived SH was significantly correlated with employees' burnout ($\beta = 0.410$; $p < 0.001$) and COBSB ($\beta = -0.323$; $p < 0.001$), confirming *H1* and *H3*. Also, employees' burnout was significantly related to COBSB ($\beta = -0.150$; $p < 0.05$), supporting *H2*. Verification of the mediating role of burnout reached the following results: the indirect effect of SH on COBSB through burnout was not significant (point estimate: -0.061 ; $p > 0.05$) (Figure 2).

The moderating effects of PS are shown in Table V. The subjects were divided into two groups based on the mean score (3.47 points) of their PS. The method suggested by Myers *et al.* (2000) was used to verify that no difference was observed between the metric model and the configural model. This means that the two groups – one with high PS and the other with low PS – have the same perception about the measurement tool to gauge the structure, and therefore, the basic requirement to analyze the moderating effect is satisfied (Table IV). In the relationship between SH and COBSB, significant moderating effects of PS were found. *H4* is, therefore, partially accepted. The negative relationship between SH and COBSB was high in the groups with low PS, meaning that when PS is lacking, the negative relationship with SH is maximized (Tables III, IV and V).

Conclusions and implications

Conclusions

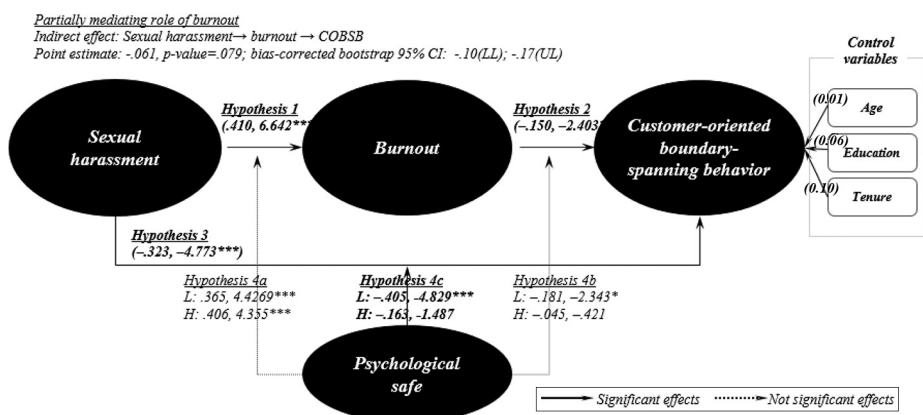

The effects of SH, as perceived by female service providers in deluxe hotels, on their burnout and (COBSB) were examined in this study, verifying the moderating role of the PS of

Notes: **p* < 0.05; ****p* < 0.001; $\chi^2 = 510.681$, *df* = 298; GFI = 0.861; NFI = 0.870; CFI = 0.941; RMSEA = 0.046; SH = sex harassment; COBSB = customer-oriented boundary-spanning behavior

employees in such causal relationships. According to the outcome of the research, the SH perceived by female hotel employees increased their burnout and decreased their COBSB. This signifies that the SH experienced by female employees in a job situation triggers their physical and mental exhaustion, leads them to losing their sense of achievement or passion for their job, and negatively affects their customer-oriented behaviors. These results were consistent with those of previous research that verified a significant relationship between SH and burnout (Hanson *et al.*, 2015; Livne and Goussinsky, 2018)

and between SH and COBSB (Li *et al.*, 2016). The moderating effect was significant; low PS significantly increased the effects of SH on COBSB. Therefore, the results suggested that it is possible to partially relieve the negative effects of SH when the employees have PS (Estrada *et al.*, 2011). On the contrary, when their PS becomes higher, the negative influence of SH on their COBSB is relatively not significant. PS is closely related with the behaviors of helping others (Frazier and Tupper, 2016). Given the Korean culture, where relationships are considered important, the influence of SH on COBSB may be partially reduced when PS increases in an organization. In the Korean culture, where a sense of unity and solidarity between groups is high, the higher the employees' PS is, the smaller the negative influence of SH on them is.

Theoretical implications

The suggested points derived from the theoretical implications of this study are as follows. First, this study expanded its scope to deluxe hotels, in which employees are more exposed to SH due to their working environment in comparison with other company groups and about which relevant research is scarce. Moreover, up to this point, the research on SH has been confined to investigations on the actual conditions of SH (Poulston, 2008; Vettori and Nicolaidis, 2016) and their relation to some negative performance (Ineson *et al.*, 2013; Ali *et al.*, 2016). Therefore, this research provides the opportunity to raise discussions on SH occurring in deluxe hotels to the surface and to promote follow-up research. Second, employees with unpleasant working experiences because of SH within their organization are highly likely to express their dissatisfaction to their customers. Such employees may exhibit negative COBSB resulting from burnout. Nonetheless, the contact frequency between service employees and customers in the service encounters of deluxe hotels is extremely high, and the employees' burnout and COBSB are important driving forces in determining the hotels' competitiveness and effectiveness. In a study by Li *et al.* (2016) in which employees' behaviors affected by SH at service encounters were examined, the determinant factor of service quality was whether the services provided to customers were satisfying their expectations. Therefore, examining employees' behaviors influencing their customer services should be able to present a very meaningful outcome. In the end, investigating the role of SH in disturbing employees' COBSB will contribute to predicting deluxe hotels' performance. Therefore, for SH policy to ultimately contribute to organizational performance, the process of improving organizational performance and competitiveness should be clarified to closely examine the clear causal relationship between SH and organizational performance and competitiveness and to present realistic alternatives. Conducting research on the association between SH policies and the positive performance of an organization is now timely. Also, in the hospitality industry, COBSB that expand the subjects of organizational citizenship behaviors into customers and organizational outsiders are significantly more crucial. Therefore, employees providing on-site services in service encounters are required not only to provide exceptional individual services to customers but also to perform arbitrary, voluntary, and extra behaviors that contribute to the company capacity by responding to outside reality and performing their roles as organizational advocates against outsiders. At this point, in time, this study is considered meaningful in having identified a significant influential relationship by verifying COBSB as a dependent variable of SH. Third, this study examined the effectiveness of PS as a new moderating variable that can affect the influence of SH within the workplace. Previous research studies have concentrated only on the negative impact of SH on organizational performance (Ones, 2018; Merkin and Shah, 2014; Salman *et al.*, 2016) and have not paid attention to the variables moderating such causal relationships. When employees have high PS in relation to

their organization, they can flexibly deal with the bullying that occurs within their workplace, and their organization's support of their PS decreases the impact of the perceived SH. This examination of the effectiveness of PS as a moderating variable completes previously unfinished work and promotes discrimination from other research.

Practical implications

These results also have practical implications. First, this study empirically verifies the effect of SH perceived by employees of deluxe hotels on their behaviors, thereby contributing to devising manager-centered and long-term countermeasures to workplace SH. In particular, both the employees who work in the closest encounters with customers and the customers themselves have key characteristics of connected behaviors. As SH may decrease the pro-social behaviors through which additional services, other than prescribed tasks, are voluntarily provided and act as a precedence factor of COBSB, devising measures to decrease the SH perceived by employees should be regarded as contributing to the improvement of customer service quality. In addition, this study is meaningful as an early study that verifies the mediating role of SH on burnout, although SH perceived by employees directly influences their COBSB. As the demands of customers increase, deluxe hotels urgently need to differentiate their customer services to survive the fierce competition, and the most important factor is the contribution of frontline employees, the key drivers of service quality improvement. Therefore, devising practical measures to decrease the SH perceived by employees in a job situation is essential. As a result, the perception regarding the unwanted sexual behaviors experienced by employees in their working environment is closely related to follow-up performance. Therefore, employee-centered policies, which enable employees – the victims to formally report and testify about what they have suffered without revenge from their assailants, should be implemented. All of the factors that contribute to the institutional control of SH within the working environment should be taken into consideration, and strict standards at the company level should be applied by criminalizing such behaviors. Employees should be trained on how to effectively cope with diverse types of SH. The fact that policies of intolerance toward SH are being implemented at the organizational level should be publicized. In more detail, videos to prevent SH at the company level should be used, thereby increasing attention to SH. Departments in charge of efficient counseling related to SH and of handling accusations should both be established. Also, systematic strategies to resolve problems related to SH when they occur are necessary. When female employees are faced with SH, the appropriateness of their legal rights should be acknowledged so that they can make a realistic response. For the resolution of such problems, victims of SH should be provided with psychological intervention and emotional support. Further, all employees should be educated on the harmful effect of SH, and discussions of ways to resolve such problems should be held. Second, given the result of this study that employees' PS may decrease the effect of SH on their behaviors, it is necessary to seek methods to promote employees' PS in an organization or a team they belong to. Employees' sense of belonging should be strengthened, and the fact that employees are a crucial part of their hotel organization should be emphasized. In addition, a mentor-mentee system should be used or a department in charge of psychotherapy should be established to promote the employees' PS.

Limitations

First, the subjects were limited to female frontline employees of 10 deluxe hotels, and the results cannot be generalized. Therefore, future research may select samples from the hospitality industry as a whole or expand the scope of the study to samples from other

countries. Second, data were collected from two different time points but depended on self-reporting by respondents, potentially deriving biased estimates. Therefore, future research should collect data with different methods to resolve such problems. Third, the data were collected using convenience sampling. Using probabilistic quota sampling would provide more general and effective results in follow-up research. Fourth, this study investigated the ripple effect of SH, with the main focus on inducing voluntary behaviors from employees. Although the importance of COBSB in the service industry was verified, more active research on the hospitality industry is considered essential from this point forward. Future research should consider including a performance variable that can precisely evaluate employees' job attitudes. Fifth, this study associated employees' general characteristics with control variables, thereby minimizing the influence of causal relationships, but it failed to consider the control effect by a specific organization or cultural characteristics. Therefore, research reflecting such limitations should be performed.

Appendix

- (1) SH
- Repeatedly told sexual jokes.
 - Unwelcome sex discussions.
 - Touch made you uncomfortable.
 - Offensive sexual gestures.

- Stared at in a sexual way.
 - Repeated requests for drinks, dinner, despite rejection.
 - Remarks made about body/sex acts.
 - Unwanted sexual attention.
- (2) Burnout
- At my work, I feel confident that I am effective at getting things done®.
 - I feel burned out from my work.
 - I feel emotionally drained from my work.
 - I feel frustrated by my job.
 - Working with people all day is really a strain for me.
- (3) COBSB
- Follows up in a timely manner to customer requests and problems.
 - Regardless of circumstances, exceptionally courteous and respectful to customers.
 - Tells outsiders that this is a great place to work.
 - Makes constructive suggestions for service improvement.
 - Shares creative solutions to customer problems with other team members.
 - Follows through in a conscientious manner on promises to customers.
- (4) PS
- If you make a mistake in this organization, it is often held against you.
 - It is difficult to ask other members of this organization for help.
 - It is safe to take a risk on this organization.
 - Members of this organization are able to bring up problems and tough issues.
 - People on this organization sometimes reject others for being different.
